REAL ESTATE AND THE CONSTRUCTION INDUSTRY

(*Address Delivered by W. C. Clark, Economist, S. W. Straus & Co., before the Seventh Annual Conference of the Harvard Committee on Economic Research, November* 13, 1925.)

The place assigned to the building industry on the program of this Seventh Annual Conference of the Harvard Committee on Economic Research is highly significant. It is much more than the normal tribute to an industry which gives employment directly to fully 5½ per cent. of those who are engaged in gainful occupations, supports, either directly or indirectly, about 10 per cent. of the nation's families, requires 250,000 freight cars for the transportation of its raw materials, and annually calls for an expenditure of about six billion dollars or approximately one-tenth of the national income, converting it into the form of durable capital. Its prominence on the program carries the implication, it seems to me, that current activity in building and real estate has at this time, an unusually vital relation to, perhaps indeed a dominating significance for the interpretation of the development of the business cycle during the next twelve months.

General Conditions Sound

To determine whether there are in the current business situation any elements which forecast an early termination to the prosperity phase of the current business cycle is, I take it, the primary purpose of this Conference. At first glance at least, such elements do not appear to be in sight. Practically all the statistical indexes point to a high degree of business prosperity at the moment. We also seem to have present practically all the conditions that should make for a continuance of this prosperity. The purchasing power of the public is enormous and well-distributed. Labor is almost fully employed at high wages. There has been a gratifying increase in the buying power of the agricultural classes not only in this country but throughout the world. The foreign demand for American goods is satisfactory. Much progress has recently been made toward the stabilization of foreign currencies (outside of France), and the outlook for permanent peace and political stability has been immensely improved by the Locarno pacts or rather by the spirit which made those international agreements possible. In the field of domestic industry, we find fewer "sore spots," fewer industries "out of luck," than for five years or more. A high rate of productive activity is being maintained on the basis of prices and costs, which are yielding a fair profit to practcally all lines of business. Neither labor nor management shows evidence of that cumulative decrease in efficiency which marks the passing of prosperity into the boom phase. Inventories, apparently, have not been accumulated in excess, in many lines. Of price inflation, there is little evidence, outside of Wall Street at least. Bank credit, in spite of the increasing drafts upon it, seems still available in ample quantity for all legitimate needs, though international gold movements and speculative credit demands will bear careful watching. Finally, our people are saving capital at an unprecedented and astounding rate.

With such a showing in the National business ledger, there is little wonder that we have been subject to the usual deluge of Gary optimism. Little wonder also, in view of our past experience with that specific, that some of our business critics should begin to throw doubts upon the situation by suggesting that the present prosperity phase of the cycle may be abruptly ended by the existence or development of that maladjustment of produc-

tion which has characterized most of the major booms of the past. Small wonder also, that these critics should say that the field in which this unbalanced production will come, if it comes at all, will be building and real estate, in view of the huge and allegedly unprecedented volume of building operations in the last few years and the extent to which real estate values are being pushed by reckless speculation in Florida and certain other parts of the country. Undoubtedly, any drastic collapse in building activity and in real estate values would go far to bring to an end the prosperity phase of the current business cycle, so closely woven into the fabric of the whole industrial and commercial structure are the building industries and so obviously have they been the main support of general business in the last two or three years. Conversely the maintenance of a high degree of building activity and the moderation of real estate speculation would almost as certainly be sufficient to maintain general business prosperity throughout the coming year.

This problem of the relation of building and real estate to the current business cycle warrants, therefore, the most careful consideration. To its more general aspects my own paper will be primarily addressed while that which is to follow, will, I believe, give you a more detailed picture of fluctuations in the building industry in the recent past.

What Is Normal Volume of Building?

Our first task is to get background for our study by a search after the elusive "normal" or long-run trend of the industry. In this way we may hope to avoid the mistakes of those small-sized experts, not yet fully oriented to the postwar horizon, who in each of the last three years have predicted "sudden and dire collapse" of the "unprecedented building boom," only to find themselves humiliated by new and ever higher annual records. Our study of the building normal leads us inevitably to a consideration of the time-worn, but by no means threadbare topic of the building shortage accumulated during the war and the early postwar years. What was the magnitude of that shortage? What has been its effect upon recent building operations? To what extent has the deficit already been made up?

Let me refer very briefly to two or three of the more recent studies of this problem:

In the July number of the *Monthly Labor Review,* Mr. H. B. Byer published the results of an investigation based on building permits issued in 130 cities in the period of 1914 to 1924 and tending to show that at the end of 1924 construction had not only made up for the war shortage, but was actually about four-tenths of a year ahead of current needs. This study is subject to two criticisms: 1. Its calculations used as a basis the value of permits issued in a single and far from typical year, namely 1914. 2. The study assumed that building activity varies simply with the population curve.

The *Commerce Monthly* for November contains the results of another investigation which is based on building permits issued in 66 urban centers with 1913 as the base and on the same assumption as to the relation between building and population. With the general conclusions of this excellent article I find myself in substantial agreement. The specific conclusion reached in regard to the shortage was that at the end of 1924 a deficit of over three billion dollars remained, which, however, at the current rate of activity would be largely eliminated before the end of 1925. If these figures be corrected to take account of the fact that the 66 urban centers selected account for not "roughly one-half" as stated, but probably for less than one-third of the total building of the country as a whole, they will not be far from results obtained by my own investigations.

However, as already hinted, I do not agree with the underlying assumption of

Meeting the Increased Demands for Service

SERVICE—more and better service of every kind, is being constantly demanded by both homes and industry in Philadelphia.

Public utilities, firms and individuals, alike, must be on their toes every minute, increasing and improving their facilities, to meet the ever changing conditions.

Builders, contractors and others, requiring building materials, may rest assured that no stone is left unturned which may tend to make a better Van Sciver Service.

226-28 South Forty-first street, Camden, N. J., $9,000. Architect, Alfred Green, 23 Broadway, Camden, N. J. Owner, Mrs. Kate Bentley, Camden, N. J. Frame, 2 stories, 15x38 feet 6 inches each, slag roof, hot air heat, electric light. Contract awarded to Robert Williams, 512 North Seventh street, Camden, N. J.

Private Patient Building, Camden, N. J. Architects, Morris & Erskine, 1716 Cherry street, Philadelphia. Owners, The Cooper Hospital, Camden, N. J. Brick, reinforced concrete, steel, stone, 3 stories and basement, 134x81 feet (plumbing, heating, electric, elevators, dumb waiters reserved), slag roof, cement and linoleum floors, hollow tile roof, ventilators, metal weather strips, shoring, Aquabar waterproofing, metal lath, marble and terrazzo work, rolled steel sash, fire and kalamein doors, bond, iron stairs, ornamental iron work, limestone, granite, mackite partitions, metal corner beads, steel partitions, rubber floors. Contract awarded W. R. Dougherty, 1610 Sansom street, Philadelphia.

Residences (4), 3019-21-25-27 Fenwick road, Camden, N. J., $16,000. Architect, private plans. Owner, Peter Gondolf, 3035 Tuckahoe street, Camden, N. J. Brick, 2 stories, 16x36 feet, slag roof, pine floors, warm air heat, electric light. Contract awarded to Milton Corson, 814 Morgan street, Camden, N. J.

Stable, Southwest Corner Sixth and Atlantic avenue, Camden, N. J., $3,000. Architect, private plans. Owners, Young & Metzner, Camden, N. J. Block, 1 story, 18x50 feet, slag roof, electric light. Contract awarded to Victor Bezahler, 1027 Atlantic avenue, Camden, N. J.

Dam, Almonessen, N. J., $10,000. Owners, Gloucester County Board of Freeholders, Woodbury, N. J. Concrete, steel and timber. Contract awarded George S. Miller & Co., Pitman, N. J.

Miscellaneous Construction News

Residences (12), 600-22 West Twenty-seventh street, Wilmington, $6,000. Architect, private plans. Owner, Charles P. Wetsell, 2523 Jefferson street, Wilmington, Del. Brick, 2 stories, 20x28 feet, slag roof, pine floors, hot water heat, electric light. Permit granted.

Residence, 2111 West Seventh street, Wilmington, Del., $3,200. Architect, private plans. Owner, F. Grovannozzi, 2126 West Eighth street, Wilmington, Del. Brick, cinder block, 2 stories, 16x36 feet, slag roof, pine floors, hot water heat, electric light. Permit granted.

Miscellaneous Contracts Awarded

Bakery, Albany, N. Y. Architect, Alexander F. Smith, 811 Penn street, Reading, Pa., and Carson & Carson, 22 South Fifteenth street, Philadelphia. Owners, Kolb Baking Co., Albany, N. Y. Reinforced concrete, brick and steel, 1 and 2 stories and basement, 171x171 feet, slag roof, cement floors, steam heat, electric light, rolled steel sash, ornamental iron work. Contract awarded to Victor Gondos, 536 Court street, Reading, Pa.

Tire Shop, Wilmington, Del. Architect, C. R. Hope, DuPont Building, Wilmington, Del. Owner, C. W. Hazel, 123 West Eleventh street, Wilmington, Del. Brick, steel, 1 story, 34x104 feet, slag roof, cement floors, steam heat, electric light, rolled steel sash, ornamental iron. Contract awarded to A. L. Lauriston, 609 Concord avenue, Wilmington, Del.

(Continued from page 4)

these two studies. I have always believed that Dr. W. I. King was right is assuming that the volume of buliding was dependent as much on growth of population as on magnitude of population and that building activity in different times and places could be compared satisfactorily only through the use of a composite index combining the two factors, namely, old population and new population, or population magnitude and population growth. By fitting a straight line to the data representing the volume of per capita building permits related to population growth in 41 representative cities for the decade 1910 to 1919, he ascertained that the normal building requirement in dollars of 1913 purchasing power was $8.59 per capita for the old population and $1,191.00 for each person added to the population. On this basis he found that 1924 was the first year in which any progress had been made in eliminating the accumulated building deficit and that on January 1, 1925, a shortage of over seven billions in current dollars remained.

While agreeing with Dr. King's theory and method, I have always felt that his results were incorrect, because of the wholly abnormal period selected—the decade which included the war years. In particular his estimate of $8.59 (1913 basis) as the building requirement per capita of old population seemed on general grounds to be too low. We know that reported fire losses alone call for a building requirement of over half a billion dollars a year. We know also that, even allowing the minimum rates, the demand for replacement of buildings because of depreciation and obsolescence is enormous for the country as a whole. When it is remembered that to these requirements should be added the demand due to the rising standard of living and the increasingly varied wants of a prosperous and progressive people (disregarding entirely the factor of growth), it should be apparent that the figure mentioned is very much of an underestimate.

Does a Building Shortage Still Exist?

Using the same assumption but a more normal period and a method which because of its simplicity, not to say crudeness, I hesitate to present to an audience before which a discussion of multiple correlation or of the Fourier formula would seem to be more appropriate, I have obtained markedly different results. To get as close a check as possible on Dr. King's results, I have accepted his own estimates of the annual volume of construction for the country as a whole (based on contracts awarded), the same index of construction costs by which to convert current dollars into 1913 dollars and the estimates of annual population and population growth made by the National Bureau of Economic Research. The fifteen-year period, 1902 to 1916, was selected as the only long period for which adequate data were vailable which had any right to be considered normal. Taking the two decennial periods 1902 to 1911 and 1907 to 1916, and assuming that there was a normal building requirement per capita of old population which might be represented by x and a normal requirement per capita of new population which might be represented by y, we were able to develop two simple algebraic equations of the folowing form:

1. (1902-11):
$$85{,}969{,}000 \times 10x + 16{,}525{,}000y = \$26{,}894{,}000{,}000$$
2. (1907-16):
$$94{,}494{,}000 \times 10x + 16{,}435{,}000y = \$28{,}314{,}000{,}000$$

Solving these simultaneous equations, we found x to have a value of $17.42 and y a value of $721.21. I would have been more doubtful of the results if these values of x and y had not been such as to solve with an error usually under 1 per cent. and only in one case approaching 2 per cent. all similar equations based on the ten-year periods 1903 to 1912, 1904 to 1913, 1905 to 1914, and 1906 to 1915 and also the equation of the whole fifteen-year period 1902 to 1916.

These results do seem to give some basis for the belief that before the war it was the "normal" or customary thing to expend on construction annually in dollars of 1913 purchasing power, $17.42 per capita for the needs of the old population and $721.21 per capita for the needs of the new population. Applying these factors to the average annual population and the annual population increase for each of the years since 1917, we find that in the five years of under-building, 1917 to 1921, the actual volume of construction was no less than $5,149,000,000 (in dollars of 1913 purchasing power) below the normal requirement for that period. Further, we find that this shortage increased during the next two years and that 1924 was the first year in which any headway was made in eliminating it. According to the standards of the 15 years just preceding the war, we should have spent on construction during the past year $5,900,000,000. According to King's estimate, we actually spent $5,900,000,000. On the same basis, the accumulated building shortage on January 1, 1925, amounted in current dollars to no less than $11,097,000,000.

I present these figures of course with hesitation and with no sense of finality. In any case, I would not be so captious as to quarrel over three of four billion dollars. You may prefer to take my results simply as a confirmation of King's general assumption and accept his estimate—that the shortage on January 1, 1925, was approximately 7 billion dollars. But whether you accept his estimate or my

estimate is of little importance. Of chief importance is the new perspective which should have been gained, the new standards by which to judge current building activity. There can now be little doubt that the widely prevalent idea that the volume of construction of the last three years has been wholly unprecedented is without foundation in solid fact. We have been confused by the money measure of this construction volume and we have underestimated the influence of population growth. The simple fact is that until 1924 we were building at a rate appreciably below the normal of the pre-war years and that only in the last few months have we attained a rate very much in excess of that normal. In 1905 the building industry ran 15.5 per cent. above the computed normal for that year while before the outbreak of the great war in Europe the industry exceeded its estimated normal in four sucessive years —namely by 3.1% in 1909, 8.1% in 1910, 13.6% in 1911 and 6.7% in 1912. Last year building was less than 2/10 of 1 per cent. above the estimated normal and if the current rate of activity keeps up to the end of the year, 1925 will close possibly 25 per cent. above the normal which my values of x and y would establish for this year.

But it would be a serious mistake to assume that the normal so computed would be the correct normal for 1925. The fact is that the building normal has changed. What was normal for the building industry in 1902-16 is not the normal of today and was not the normal of the last 7 or 8 years. Hence when we speak of the accumulated building shortage as amounting to 7 or 11 billions at the first of this year, we do not in any sense mean that on that date there was an actual or urgent shortage of buildings of that value—that people were going without roofs over their heads and that business was suffering serious hardship because of inadequate quarters. Every-day observation, the increasing stabilization of rents and the evidence of over-building in some quarters offer sufficient proof that this was not so, at least not in any general sense. What we do mean is simply that the cumulative total of under-building (that is, of building at a rate below the pre-war years) in the 7 years 1917 to 1923 which has not been offset by the overbuilding of the year 1924 amounted to the figure stated.

Will Shortage Ever Be Made Up?

Will this large volume of under-building ever be wholly offset by the over-building of later years? Emphatically no, in my opinion. In fact I believe that by the end of this year the influence of the accumulated deficit will be largely past and further that its influence on the recent volume of building activity has been greatly exaggerated. Its significance has been not so much by way of inflating the actual magnitude of construction operations as in causing a very rapid expansion in the capacity of the building industry and maintaining construction volume at a uniformly high and increasing level regardless of depressed conditions in general business and regardless of a wide and at times increasing spread between building costs and the general price level.

Two or three considerations explain why the deficit will never be wholly made up. In the first place, the deficit was in part made up during the years of under-building by the use of buildings longer than they would otherwise have been used. How important this factor of postponed obsolescence was may be appreciated by a simple calculation of the amount of depreciation and obsolescence of the country's buildings that would accumulate at a rate of 2 or 3 per cent, over a five or six year period. In the second place the rate of population increase during the period 1917 to 1921 was undoubtedly lower than before the war and further the annual increments of population increase in those years as in the years since 1921 would, because of practical or legal immigration restrictions, contain an unduly low proportion of adults and would therefore call for a less than normal amount of building for the needs of the new population.

Unfortunately it is still too early to ascertain with any degree of certainty or accuracy the normal for the period which began in 1922 or 1923. We can only set out on the one hand the forces which will tend to produce a normal lower than the pre-war standard and on the other hand the forces that will make for a higher normal, with a guess as to the net resultant of these two conflicting sets of forces.

Factors Making for Lower Normal

Working to produce a lower normal will be the continuing influence of a factor already mentioned, namely, the legal restriction of immigration and its effect on the proportion of adults in the annual increments of population. This would be accentuated by any slowing up of the rate of population increase, though an increase in the marriage rate or a tendency to earlier marriages would go far to offset this factor.

Perhaps of more importance is the movement to increase the efficiency of building plans. The economies of space which we were forced to introduce as a result of bitter necessity during the war and post-war years have taught us lessons which will mean a permanent reduction in our building demand. The utmost ingenuity is now being exercised by architects, engineers, building managers and all those responsible for the planning and financing of modern buildings to the end that waste space in office buildings, apartment houses, hotels, and even residences may be reduced to the minimum. The vogue of the multi-family apartment house, of the kitchenette or efficiency type of apartment and of the residential apartment hotel is also in part the result of a desire to secure accommodations which will represent a more efficient and more economical utilization of materials and of labor. The relative popularity of these new types of residential facilities will show some variations in the future but, speaking generally, all three have come to stay, and each in varying degree will influence the building demand of the future.

Finally the building normal of the future will tend to be lowered by the use of better methods of construction or more durable materials which will increase the average physical life of American buildings and by increased attention to the planning of both buildings and cities, which will increase the average economic life of urban properties.

Working in the opposite direction are a number of powerful economic forces whose combined effect may be greater than that of those forces which will tend to depress the building normal below the level of pre-war years.

Effect of Rising Standard of Living

Of most importance are those factors which are based on the rapidly increasing wealth of this country and on the fact that the American standard of living is a constantly rising one. Prices and money wages may rise and fall but except for short periods the real incomes of the American people steadily increase.

Now, the building industry is perhaps the nation's most accurate index of the improved standard of living on the part of the American public. It is in the home that one finds expression given to the universal desire of all persons to live more conveniently, more comfortably, more efficiently. Inventions and innovations are constantly being introduced which raise the standards of convenience in the average American home. Hence, we find the demand for two or three baths instead of one, for tiled bathrooms and modern plumbing instead of the tin bathtub and the antiquated fixtures of a decade or so ago, for superior electric fixtures, for breakfast rooms and libraries and sleeping porches, and for all sorts of built-in equipment. Hence, also, we find that the apartment house which was the pride of its district fifteen or twenty years ago has been rendered obsolete or nearly so by the modern style and the diverse facilities of the structures which are being erected today.

And the end is not yet! In spite of the progress which has already been made, it is probably safe to say that less than half of the American people are housed today according to standards which they

believe they have a right to expect. Already concerted efforts are being made in several localities to wipe out the slum districts of our cities and to build so-called "model" suburbs for the housing of our industrial workers. This is a movement which is just beginning, but which we venture to say will multiply in importance in the next few years. The American public is rapidly coming to the conclusion that the slum is not only an anachronism but a serious evil which cannot be and need not be tolerated under American conditions.

The same demand for improved accommodations is not confined to the home. It is found in the modern office building in a demand for the most rapid and most efficient elevator service, for the most efficient ventilation and temperature-regulating installations, for adequate toilet facilities, for rest rooms and lunch rooms and libraries, for safety deposit vaults, for extensive quarters for an elaborate and highly organized administrative staff, for equipment and facilities of the most modern type and for an exterior that combines beauty with utility. The fittings and the "period" furniture of many modern private offices are on a par with the standards of comfort and beauty maintained in the homes of their occupants. In a similar way the high grade modern shop or store is setting new standards in its layout, finish and equipment.

New Type of Facilities

Another result of continual progress and of a rising standard of living is the demand for new types of building facilities to meet new needs. The "popularization" of the automobile, for instance, means that the owners of 16 or 17 million cars now require a garage in which to store their cars in addition to a house in which to live and a place in which to work. Indeed in many cases they need not only a garage or two at their place of residence, but also parking facilities in an up-to-date public garage in the down-town district. In 1923, the garages built in 269 cities called for an expenditure of about $165,000,000, or half the total construction volume for the city of Chicago. Even more important is the demand for down-town and memorial clubs and country club houses. The organization of these social and recreational clubs has in recent years reached the proportions of a "popular movement." Last year over $370,000,000 was spent for this purpose alone. Do not forget also the tremendous effort which the insistent public demand for facilities for travel, play and amusement is having on the construction industry. Think of the hotel facilities which are now demanded, think of Florida, the new playground of America, and think of the huge sums which are now being expended on the construction of elaborate moving picture palaces in all important neighborhoods. Amusement buildings contracted for so far this year have been estimated to cost no less than $250,000,000.

The demand for higher standards of beauty, convenience and efficiency is not confined to the American people as individuals. In their collective capacity as the residents of American cities, they are demanded more and more. Public and quasi-public improvements now in process or in contemplation in our larger cities call for expenditures of huge amounts of money. In Chicago alone it has been estimated that the improvements involved in the South Water Street development, the straightening of the Chicago River, the building of new railroad terminals, the widening of North La-Salle Street and numerous other civic projects will involve an expenditure running into billions of dollars.

The rising standard of living which this improved accommodation and these new demands reflect is a factor that will continue to influence the building industry indefinitely, because it is based on the spirit of progress and is made possible by the abundance and variety of our natural resources, the efficiency of American laborers and the enterprise of the American business man. In other words, our people have a high standard of living because they can afford it. They are demanding that our cities be rebuilt in accordance with their new standards of beauty, comfort and efficiency; and they have the purchasing power wherewith to make their demand effective. These new demands, these rising standards, mean that the process of obsolescence has been speeded up in so far as old buildings are concerned, though more scientific direction of city growth, zoning ordinances, better planning of buildings and the more normal progress of the building arts will probably reduce as already indicated the rate of obsolescence of the buildings which are now being built. The large number of building structures of various kinds which the rising standards of living have made obsolete or practically obsolete is one of the chief factors which makes it difficult to estimate the extent of the present building shortage. Sufficient building units may be extant but they may not be of the kind and quality which are now demanded.

Influence of Population Shifts

From the point of view of building demand, shifting of population is almost as significant as actual increase in population. There is little reason to believe that such population shifts will be any the less important in the next few years than they were before the war.

The movement from the rural districts to the cities is a continuing movement, the influence of which cannot be overlooked. It is not improbable that the return of agricultural prosperity will slow up to some extent the rate of rural exodus which has characterized the last four or five years, but it is futile to expect any perceptible return flow of population from the cities to the farms and I see no reason why the city-ward drift will not continue at probably fully the pre-war rate.

Similar shifts of population are expected by many to be caused by the process of decentralization which the development of hydro-electric power and the increasing congestion of our metropolitan cities may bring. These may or may not materialize. However, there can be no doubt about one important shift which is now in progress, namely, the hegira to Florida. With the astounding gains in building activity already recorded by Florida cities you are all familiar. However, because of the fantastic extremes to which land values have been pushed, we are all apt to discount the permanent influence of Florida upon biulding demand. It may therefore interest you to hear the following extract from a recent extensive report upon the Florida boom by the Standard Statistics Service:

"In the opinion of this Service, the building program for the State of Florida will be further augmented over the next several years. Notwithstanding the heavy expenditures of the past two years, facilities of every type are inadequate not only for the population now in the state the year round, but more particularly to take care of the heavy seasonal increase to be expected each Winter.

"Moreover, land values in many centers have now advanced so high that the present owners can no longer afford to hold on to properties from which there is no rental return, merely in the hopes of further speculative profits from rising land values. The stage has now been reached when remunerative buildings must be constructed, and upon this stage of its building program Florida is only starting.

"Whatever may be the prospect for the building industry for the United States as a whole, the Florida prospect is quite clearly against any sharp abatement during the next several years. Thousands of people with available funds have purchased residential sites and now find themselves unable to begin construction, owing to the shortage of labor and materials. As the first flush of the heavy office building, commercial building, public utility, highway and development project construction passes, these individuals will be able to build and by so doing will maintain the Florida building program at high levels."

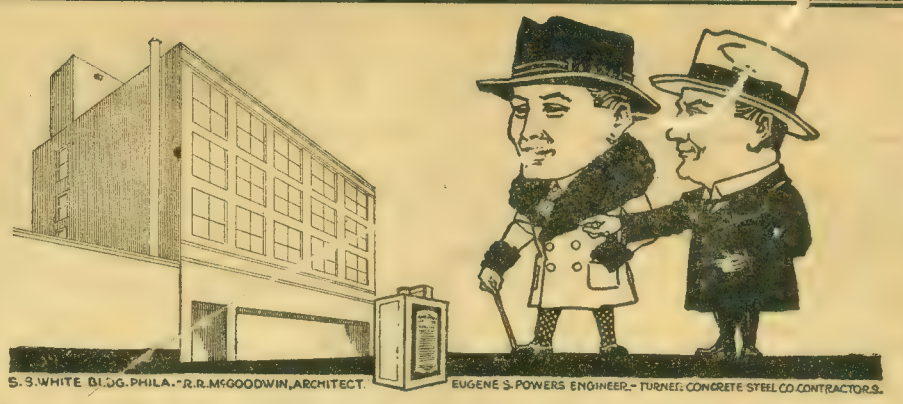
Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."



Represent North America.

Insurance Company of North America

PHILADELPHIA

and the

Indemnity Insurance Company of North America write practically every form of insurance except life

"Don't let freezing weather stop your concrete work—use 'ANTI-HYDRO' and keep right on!"

"ANTI-HYDRO" lowers the freezing point of concrete to 15 degrees F. so that work can continue even though the thermometer goes way down. At the same time, "ANTI-HYDRO" *permanently* hardens and waterproofs concrete mixtures *in one operation.* Being a liquid integral compound, it mixes easily with the gauging water without the aid of skilled labor.

The concrete work on this building continued right on through the freezing weather. Much valuable time was saved and results were entirely satisfactory.

For 21 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Use it also for cold weather work. It will save you time and money.

As The Editor Sees It

THE estimated cost of all buildings, alterations, additions, repairs, and miscellaneous work for which permits were issued by the Philadelphia Bureau of Building Inspection in 1925 was $170,913,530, according to detailed reports printed on other pages of this issue of the GUIDE, an increase of $29,-176,070 over 1924, which before 1925 was the greatest record of any year.

Dwelling construction showed an increase in 1925 of 2937 houses of all types over 1924 at an increase in estimated cost of $12,434,240. Philadelphia was 18,556 houses short of requirements at the beginning of 1925. This year the increase of 5,804 over the average number 7,150, of houses built annually, heretofore has reduced the house shortage in Philadelphia to 5,602 houses. 12,954 houses of all types were built in 1925 and only 10,017 were built in 1924. As is generally the case residential building led all classes of building in 1925 with $70,207.-465, compared to $57.773,225 expended in 1924 for residences.

Next to residential construction, stores showed the greatest value, as $20,016.-865 was the cost of buildings of this class. In 1924 only $2.796,050 was expended in stores. The enormous increase in this class of construction in 1925 is due to the new twelve story department store building to be erected at 9th and Chestnut Streets, for Gimbel Brothers. The store will cost $18,000,000, according to the permit, which is the largest single permit ever issued by the Bureau of Building Inspection. Tenement Houses came next in volume with 95 new structures costing $15,522,000, an increase in number of 45 at an increased value of $6,639,000. Office Buildings were next in order with 48 costing $11,073,100, an increase of 10 over 1924 at an increased value of $931,900. Schools, next in volume, 18 at a cost of $9,938,070, an increase of only two but at a large increase in cost, 16 having a value of $4,394,435 having been built in 1924. Garages again showed a big increase and were next in volume of cost, although a smaller number were built in 1925 than in 1924, but the cost greater, 2,778 garages costing $6.951,430 were built in 1924 and only 2,381 costing however $8.191,025 were built in 1925. Manufactories showed a decline in 1925 in value, but an increase in number, 59 costing $5,873,735 were built in 1924 and 70 costing only $3.962,-720 were started in 1925. Churches showed a marked decline in number and value, 27 costing $2,620,850 built in 1924 compared to 11 costing $915,150.

March exceeded all months in the number of operations started with 4,164, although the banner month in point of value of new work was July with $30,-717,760 the greatest month the city ever experienced in volume of construction started. This was due again to the Gimbel store permit of $18,000,000.

Estimated cost for each month, 1925:

Month	Permits	Operations	Estimated Cost
Jan.	614	964	$6,567,755
Feb.	957	1,929	10,320,835
Mar	1,718	4,164	22,424,530
Apr.	1,461	2,848	21,110,645
May	1,369	2,423	14,434,300
June	1,310	2,304	11,156,450
July	1,413	2,357	30,757,760
Aug.	1,159	1,768	9,946,680
Sept.	1,189	1,736	9,392,390
Oct.	1,174	2,204	12,850,990
Nov.	891	1,442	13,303,765

The following table shows the total for each year back to and including 1909:

Year	Operations	Estimated Cost
1909	17,294	$ 42,881,370
1910	16,383	37,866,565
1911	16,215	40,030,985
1912	14,907	37,173,635
1913	14,813	38,763,850
1914	15,709	35,419,605
1915	17,712	39,444,125
1916	15,613	49,896,570
1917	8,977	34,016,408
1918	5,950	15,452,670
1919	14,509	65,088,750
1920	12,512	55,305,400
1921	14,654	42,790,780
1922	22,588	114,881,040
1923	21,546	122,650,935
1924	24,234	141,737,460
1925	25,307	170,913,530

More money was spent on garage construction in 1925 than in any year on record although the number of garages is not so large as in the two preceding years.

Record of Eleven Years

The number of garages, with estimated cost, for the last eleven years follows:

Year	No. of Garages	Cost
1915	595	$ 723,260
1916	878	1,307,340
1917	833	1,296,310
1918	480	833,320
1919	1,322	2,726,540
1920	1,153	2,502,290
1921	1,569	3,505,695
1922	1,909	5,072,765
1923	2,522	5,415,885
1924	2,778	6,951,430
1925	2,381	8,191,025

The most active month in garage construction was April with 323 garages started, although March was almost as active in number started with 315.

The total number of garages erected in 1925 according to permits issued by the Bureau of Building Inspection follows:

Month	No. of Garages	Cost
January	68	$ 320,290
February	137	591,195
March	315	854,170
April	323	918,680
May	264	897,590
June	213	637,020
July	219	817,315
August	161	525,305
September	210	715,310
October	186	392,985
November	145	485,405
December	140	1,035,760
	2,381	$8,191,025

The Forty-second Ward with 2964 dwellings erected in 1925 led all districts. The Thirty-fifth Ward with 1742 dwellings and the Fortieth Ward with 1720 residences followed in the greatest number. These three wards showed substantial increases over 1924. Material gains were made in the 21st, 22nd, 23rd, 36th, 38th, 39th, 41st and 45th wards.

Contemplated new work for 1926 shows a tendency toward public works, industrial buildings and smaller types of residential buildings. Some new office buildings are being planned. These and a large programme of school construction assure continued activity for some time for the Building Trades although it is not supposed that 1926 will exceed 1925.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

The Newest in Hot Water Heating

Have you seen the latest improvement in round house heating boilers? It is called the "Combustion Ring" (shown below) and it surrounds the firepot to a height of 4½ inches above the grates. It has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-1

FIRE INSURANCE IN ALL ITS BRANCHES

No More Ashes To Lug

No clumsy pan to spill dust and dirt on the kitchen floor

The Glenwood Ash Chute

solves the problem. It is located just beneath the grate and connected by a sheet iron pipe straight down through the kitchen floor to ash barrel in cellar. No part is in sight. Not a particle of dust can escape. Just slide the damper once each day and drop the ashes directly into the ash barrel.

The Dust-Tight Cover

to barrel is another entirely new Glenwood Idea and is very ingenious. This is only one of the splendid improvements of the new plain

Cabinet Glenwood

the Range without ornamentation or fancy nickel, "The Mission Style" Glenwood. Every essential refined and improved upon. This Range can be had with the latest and most improved Elevated or End Gas Range attachments. It can be furnished with fire box at either right or left of oven as ordered. Our handsome booklet tells all about it.

The Cabinet Glenwood

Henry M. Miller, 46-48-50 North Second St., Philadelphia, Sales Agent

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America

Indemnity Insurance Company of North America
write practically every form of insurance except life

"ANTI-HYDRO" Lowers the Freezing Point of Concrete to 15° F.

You don't have to stop your Concrete and masonry work during freezing weather if you use "ANTI-HYDRO." All the brick work in this building was laid during freezing weather; results were entirely satisfactory.

"ANTI-HYDRO" is a liquid integral compound which also makes concrete permanently hard and waterproof all in one operation. It is easy and economical to use—simply mix it with the gauging water—no skilled labor required.

During the 21 years that "ANTI-HYDRO" has been in use, it has never failed to produce satisfactory results. Use it on your next job.

As The Editor Sees It

REAL ESTATE AND THE CONSTRUCTION INDUSTRY

(Address Delivered by W. C. Clark, Economist, S. W. Straus & Co., before the Seventh Annual Conference of the Harvard Committee on Economic Research, November 13, 1925.)

(Continued from issue of January 6th)

The Suburban Movement

Finally, the suburban movement is a powerful force which will continue to increase the demands upon the construction industry. Even if the record pace of the last two or three years should not be maintained, it is probable that the suburban movement will continue at a more rapid rate than before the War. Much of the residential building in the larger cities in the last few years is a result of this movement from the congested centers of our cities to the suburbs where the advantages of living in the country can now be secured without sacrifice of many of the conveniences and pleasures of the city. The automobile, the motor bus, the electric trolley, and more adequate steam transportation have brought the suburban home within the range of the great mass of middle-class families, even though the breadwinners must continue to work in the city. The chain store is bringing to every community the same efficient merchandising which the city dweller enjoys, while the motion picture, the radio, the municipal golf course and the community center are equalizing the score in so far as cultural and recreational advantages are concerned.

The movement to suburban districts increases the demand for building in several ways. In the suburban areas, it means a demand not only for homes but also for schools, churches, post-offices, city halls, club houses, shops, stores, an all the complex capital equipment of the modern city. Again in the district from which the population shifts its abode, it means in many cases either the alteration of old buildings and their adaptation to new uses or their complete demolition and replacement by entirely new types of structures. Where such functional changes do not take place, and the vacated property continues to be used for residential purposes, it is taken care of by the perpetual increase in the city's population. The growth of the city proper continues in spite of the suburban movement. There is always a proportion of the population which prefers the conveniences and other attractions of a home close to the hub of the city's life. Thus, either from choice or from necessity, tenants will continue to look for the city home or the near-in-apartment house or hotel. In the larger cities, also, a factor of increasing importance is the demand of the well-to-do who spend their summers in their suburban country homes and who also demand a down-town apartment de luxe for the winter months.

The net result of all these conflicting forces it is difficult to estimate in precise quantitative terms. Yet the number and character of the forces making for a higher normal are such that he would be a bold prophet who would assert that the building normal of the future is likely to be less than that of pre-war years. If I am right in concluding that it is likely to approximate the pre-war normal and if either Dr. King's or my own estimate of that normal is reasonably correct, we may safely conclude that the building cycle of the future will play about a level not markedly lower than that of the last few years.

Thus after a long but I think necessary digression, we return to the immediate object of our inquiry, the cyclical movement of building during the next few months and its relation to the similar

movements of general business. It will be recalled that the building industry, or rather the unsatisfactory but only indexes we have of building activity, namely, building permits and contracts awarded, tend to move early in the business cycle. On the upward swing of the cycle they have usually preceded the movement of general business (notably in 1903-04 and in the recovery after the depression of 1920-21), but to this rule there have been a number of exceptions, as for instance in 1911-12. On the downswing, however, building permits almost invariably anticipated the reactions in the general business curve. For instance, an examination of the three major cycles preceding the war will show that building permits preceded business by intervals of from two to six months. This historical experience gives further justification to those who are watching the building curve so closely for omens of import to general business.

Those who fear that a rapid downward movement of the building curve will come in the course of the next few months point to certain evidences of local over-building, increasing vacancies, and apparent weakness in the rental market.

Overbuilding Local and Sporadic

Now it is true that there has been over-building, but by and large only in certain sections of certain cities or in certain types of facilities in a number of cities. We must be careful not to generalize too quickly from scattering local evidences. A city may be over-built in high-class eight to eleven-room apartments, but very much under-built in apartments which offer four, five or six rooms at moderate prices. Similarly, the Rogers Park district of Chicago may be over-built generally while even a very similar district in another section of the city, say, the South Shore area, may have an inadequate supply of residential facilities for those who prefer to live in that section. Of course there is competition on the margin, especially in time of depression, between all sections of a city and to some extent between various kinds of facilities, but those who are actively engaged in the renting or real estate lending business know that this competition is far from being "free," in the economic sense. In the summary of their semi-annual survey of 225 cities for June, 1925, the National Association of Real Estate Boards reported that 30 per cent. of the cities indicated some degree of over-building in some type of construction but only 3 per cent. in all types. Further, as compared with June, 1924, there was a considerable increase in the number reporting over-building in some type of construction but no increase in the number reporting general over-building. In this connection it should be noted that in a growing city, a moderate over-building soon corrects itself unless indeed building activity continues at an abnormal rate. Now, in the last year at any rate, there has been evidence in several quarters of a disposition on the part of builders to allow this automatic correction process to work itself out. Thus several cities and districts which were reported as over-built in certain types of structures a year ago have not shared in the high rate of activity of the last few months. In some districts residential building which bulked so large in last year's total has been less prominent in the operations for 1925. After a record-breaking year in 1924, New York experienced a lull in the first half of the current year but the break-neck pace was once more resumed in August and 1925 will hang up another record. An appeal for caution in high class apartment building in Chicago issued in the fall of 1923 by our own organization was followed by a moderation of operations in that particular line which allowed a better absorption of space during the past year and a renewal of activity in recent months. Los Angeles offers another instance of a moderation of the pace of a very active building boom with-

out collapse, though the slack in certain types of facilities in that city has not yet been fully taken up.

The Rental Market

The condition of the rental market is but a reflection of the extent of over-building or under-building and the presence or absence of vacancies. In the last few weeks we have been told by several persons that rents were on the toboggan. Let us first see what the actual facts are. The general rent or shelter index of the United States Bureau of Labor statistics has fallen slightly since last December—or from 168.2 to 167.4. In twenty out of thirty-two cities studied by the Bureau, decreases of varying amounts were reported for the current year. In the June, 1925, report of the National Association of Real Estate Boards, eleven per cent. showed residential rents rising compared with ten per cent. a year ago, while 19 per cent. reported falling rents and 70 per cent. stationary rents as compared with June, 1924, figures of 16 and 74 per cent. respectively. As for business rents,

the last figures of the Board were for December, 1924, when the situation was as follows:

	Dec. 1924	Nov. 1923
Falling	8	6
Rising	45	57
Stationary	47	37

This side of the story would not be complete without a reference to the concessions which have been granted by speculative builders anxious to fill up their buildings and establish a high gross rental for sales purposes.

But the story would be one-sided unless due attention were paid to the following considerations. In the first place, it is wholly natural that the first turn of the tide in rentals should strike us with exaggerated significance. We recall that during the war when prices were climbing at an alarming rate, house rents rose only slowly. When in 1920 the Department of Labor's index of the cost of living had reached 210 and its wholesale price index 250, the house rent index had not yet attained 160. In the ensuing depression house rents remained practically stable in the face of a headlong tumble in other prices and then in 1922 began again to rise, this time much more rapidly than whoelsale or retail prices generally. It would be only natural for property owners in their effort to overtake the general price level to push their rentals somewhat too high and only human nature for us to exaggerate the significance of the first evidence that the peak had been reached and that a slight corrective reaction had occurred. It is also only natural for weak owners of property to become somewhat panicky and for tenants to become too enthusiastic upon the first evidence of vacancies. We have been living in an entirely abnormal market—a seller's market, a market in which demand constantly and uniformly exceeded supply.

Reasonable Vacancy Normal and Desirable

This brings me to my second point that a moderate percentage of vacancy is not only a normal but also a desirable and necessary phenomenon. Such a vacancy is necessary (1) to allow some freedom of choice and of movement without which the tenant is at the mercy of the landlord; (2) to compensate for the inevitable, considerable error in the distribution of facilities by tpyes, sizes, price groups and locations; (3) to allow for the gradual obsolescence of buildings and the shifting of districts; and (4) to take care of the factor of continuous growth in our dynamic American cities. In residential facilities, the normal vacancy is at least 5 per cent. and any reputable builder or lending house will normally make allowance for a vacancy of at least 10 per cent. and possibly up to 20 or more per cent. (depending on the type and location of structure), before going ahead with a building or financing project. Incidentally, I may mention that a recent exhaustive survey of every block in the two large sections of Chicago which have sometimes been reported to be largely over-built disclosed a vacancy of about 9 per cent. in the one case and about 10 per cent. in the other, with any appreciable surplus confined to two or three sizes of apartment units.

In the third place it will usually be found that most of the vacancies which do exist today are in locations which are not yet established as desirable or in buildings which are, so to speak, on the margin of obsolescence, either because of age and inadequate upkeep or inefficient planning or cheap construction or indifferent management. In many casas these buildings are vacant because they are obsolete or practically so. Their present condition represents an inevitable readjustment to changing economic conditions.

And finally, it is probably well to note that particularly in office buildings, a better control of the rental market is being exercised. In the fast few years a new profession has sprung up, the profession of building management. The new group of building managers bring to their job a scientific point of view and somewhat of a research technique; they exchange experience and information not only to improve their operating technique but also to acquire an accurate knowledge of supply and demand conditions in their market; they know their overhead and their operating costs; and they have learned that the inelasticity of demand for office space is such that cutting rates contributes little to the appearance of their balance sheets. Their objective is to operate our great modern buildings in such a way as to produce a reasonable return upon the investment made by their owners. An instance of their comparative success will doubtless be cited by Colonel Ayers who comes from Cleveland where the office vacancy for the last year or two has run around 18 or 20 per cent. without that demoralization of rents which might have been expected.

Outside of the effect of local overbuilding and of the cyclical fluctuations of building and general business, I cannot see adequate reason for expecting any material decline in the level of rents.

Sources of Building Demand

If building is to continue on a high level for some time, from what quarters will the demand come?

While the National Association of Real Estate Boards reported some instances of over-building, its report also indicated the persistence of shortages in some sections. Of the 225 cities studied, 32 per cent. reported shortages of single family houses, 29 per cent. of apartment houses, and 25 per cent. of business buildings. These figures represent a considerable drop from the numbers reporting a shortage in 1924. They indicate that considerable progress had been made in eliminating the accumulated deficit and further progress has of course been made in the last few months. Probably, however, there will still remain at the end of this year a number of cities where the demand for building to wipe out shortages of certain classes of facilities will be added to the normal heavy demand for construction to take care of replacements and annual population growth. Almost universally, demand seems still to be ahead of supply in so far as residential facilities for families of low and moderate incomes are concerned.

The special situation in Florida has already been discussed. In somewhat similar case we find the farms and the rural districts of almost the entire country. The building boom of the last few years has been largely confined to the cities and particularly to the larger cities. In the smaller towns and upon the farms there must still exist a large backlog of demand for repairs, replacements and extensions, which must sooner or later inflate the annual increment of building demand. Its influence has already been felt in those areas which have recently felt the stimulus of the increasing purchasing power of the farmers. In the Ninth Federal Reserve District, for instance, a very marked revival of building has occurred in the smaller cities. In nine out of fifteen small cities reporting to the Federal Reserve Bank of Minneapolis, permits issued during the first nine months of 1925 exceeded by 50 per cent. or more the volume for the corresponding part of 1924, while only two cities reported decreases.

(To be continued.)

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

Repitition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

"ANTI-HYDRO" Lowers the Freezing Point of Concrete to 15° F.

You don't have to stop your Concrete and masonry work during freezing weather if you use "ANTI-HYDRO." All the brick work in this building was laid during freezing weather; results were entirely satisfactory.

"ANTI-HYDRO" is a liquid integral compound which also makes concrete permanently hard and waterproof all in one operation. It is easy and economical to use—simply mix it with the gauging water—no skilled labor required.

During the 21 years that "ANTI-HYDRO" has been in use, it has never failed to produce satisfactory results. Use it on your next job.

As The Editor Sees It

REAL ESTATE AND THE CONSTRUCTION INDUSTRY

(Address Delivered by W. C. Clark, Economist, S. W. Straus & Co., before the Seventh Annual Conference of the Harvard Committee on Economic Research, November 13, 1925.)

(Continued from issue of January 20)

Industrial Building Likely to Increase

Industrial building which since 1920 has been insignificant in amount should also show expansion during the next few months. It is of course notorious that plant capacity has been much in excess of current consumptive demand in several important basic industries, but we should not forget (1) that some of this surplus capacity has become obsolete in the last five or six years (witness the current controversy as to the theoretical capacity of the steel industry); (2) that the growth of this country tends to absorb very quickly a surplus of productive capacity (witness the fact that in the last five years we have added to our population an increment of people exceeding the total population of the whole of Canada which in 1920 had 3 ½ billion dollars invested in manufacturing plants); (3) that the great agricultural and foreign consuming markets for the products of American factories are just now beginning to emerge from serious depression into what we hope will be a prolonged period of reasonable prosperity; and (4) that the need for plant expansion had been or will be accentuated to some extent by such factors as the Pittsburgh plus decision, revision of freight rates, the growing use of electric power and the increasing industrialization of the South. Hence under the stimulus of good business, industrial replacements and extensions should take a more and more important place. The movement has already started. In September, the Dodge index of industrial construction reached a figure above normal for the first time in two years, jumping from 94 in August to 155 in September. October is also expected to show a high figure for this type of structure.

Commercial building will continue closely dependent upon the degree of business prosperity. While public utility construction has been heavy, the volume of contemplated work reported in recent months indicates a continuing heavy volume of demand. In spite of changing tax rates, municipal improvements will continue in heavy volume. In particular, the serious shortage of educational buildings has not been fully offset in most communities, while in some cities water supply and sewage disposal problems are beginning to press upon public attention.

All these accumulated demands are in addition to the huge normal volume of building needed to take care of replacements and annual population growth, but from this combined total should be deducted whatever of over-building has occurred in those sections and for those types of structure which have witnessed the most active operations in the last few years.

Some justification for the general tenor of these remarks seems at hand in the story of the record-breaking activity of 1925 and particularly of the last few months. In building permits issued, October registered an increase over the same month of 1924 amounting to almost 50 per cent. for the 25 leading cities and to 28 per cent. for all the 395 cities reporting to S. W. Straus & Co. Gains both from September and from last October were scored in every section of the country. This active October is the more significant in that it followed a record August and a record September. Similarly with new construction started, October

ran 27 per cent. ahead of last October, while the year 1925 at the end of its tenth month is 28 per cent. in excess of the full year 1924. Contemplated new work also exceeded September's figure by a gratifying margin and also that of October, 1924, by over 50 per cent. Not only does this heavy volume of permits issued, contracts awarded and projects contemplated assure a high volume of actual contsruction for six to eight months or more, but it also seems to bear eloquent testimony to the continuing strength of the demand for new construction.

Dangers to Be Avoided

On the other hand it calls for a note of caution. For there are a number of signs that in some sections part of this recent tremendous increase in building activity is speculative building based on the stimulus of easy money. There is, in my opinion, too much vitality in the movement to explain it wholly or perhaps even largely on this ground, but certainly the easy money stimulus and the rapid multiplication of lending agencies have played an important part in certain areas. To the extent that this factor is effective, current building activity is subject to the danger of reaction caused by rising money rates. Such a tightening of the credit situation does not seem to be a matter of the proximate future, but this subject we shall have to leave for other speakers.

A second caution I would like to leave with you. Unfortunately a good deal of the present building represents unsound building, either because the projects are unwisely conceived or the locations poorly chosen or the building inefficiently designed or the construction cheap and hasty. Such unsound developments are storing up trouble for all of us. The firm with which I am connected has always prided itself on the experience and skill of its organization in the choice of locations, the intensive utilization of sites, the efficient planning of buildings and the careful supervision of construction. Yet at the present time, wherever practicable, we are having the owners of large commercial projects which we are to finance, secure the benefit of the experience, not only of our own architectural and engineering departments, but also of the building planning service of the National Association of Building Owners and Managers. This service assures that the plans are drawn with the greatest efficiency from the operating and renting standpoint and also gives an additional check on the earning possibilities and the economic wisdom of the project.

Speculation in Unimproved Lots

The third danger in the current situation is the unbridled speculation which has developed in unimproved land, particularly in Florida but also in or near a number of our large Northern cities. The orgy of speculation which Florida presents has been compared to the stock market without the protection of the bear element and the other safeguards of regulating committees. On the other hand, we should not forget that the boom has a real basis, that much solid value has been created by the increase of transportation facilities and other development work, and that steps are being taken by the responsible realtors of the state to moderate the speculative fever and check the excesses. I am told that the situation is even now much less hectic than it was a month ago and there is reason to hope that the policy of control referred to above will meet with further success. Even when values are stabilized on a more reasonable basis, as is likely by next summer, it is probable that the collapse will not have as serious an effect on the general business situation as some people expect.

But Florida is not the only center of real estate speculation. Incidents like the Far Rockaway boom on Long Island and the subdivision activity surrounding a number of our larger cities have led to the suggestion that we are in the midst

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

The Newest in Hot Water Heating

Have you seen the latest improvement in round house heating boilers? It is called the "Combustion Ring" (shown below) and it surrounds the firepot to a height of 4½ inches above the grates. It has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-1

Will contain stores, offices, banquet hall, assembly rooms, gym and roof garden, 12 stories. Plans in progress.

(Continued from page 52)

of an old-fashioned land boom. In any case there is evidence of over-subdividing around a number of cities and the pushing of values upward to levels which are not likely to be justified by the development of the next five or ten years. Here again there is some hpoe of a certain moderating influence being exercised by responsible organizations and some hope also, in view of the strong credit situation and the high rate of national saving, of escaping some of the bad effects on general business of similar excesses in our past history.

Conclusion

If I may express my general conclusion in a brief paragraph, I believe that building activity, that is to say, actual construction operations, will continue on a high level certainly for another six months and probably also throughout practically all of next year. If we are able to avoid a serious credit stringency, building activity, by a process of shifting from one district to another and from one type of structure to another, by a reliance chiefly upon the tremendous volume of demand for normal replacements and the normal increase in population and prosperity, and by a more or less deliberate control of some of the excesses which are now apparent in certain quarters, will show a gradual tapering off instead of a drastic collapse, and should remain adequate in volume to avoid being the cause of a general business depression.

NATIONAL MONTHLY BUILDING SURVEY

Prepared by S. W. Straus & Co.

Official reports of building permits issued and plans filed in the leading centers of the country during the year 1925, verified predictions of a record-breaking year. Based on reports from 391 cities which comprise 81 per cent. of the population in all places of 8,000 or more, the volume of building in the United States for the year was approximately $6,500,000,000 as compared with the estimate made in this survey a year ago of $5,750,000,000 for the year 1924.

In the 391 centers which represent about 37 per cent of the entire population of the United States, the volume of construction officially reported was $4,451,959,830, compared with $3,740,791,486 in 1924, a gain of $711,168,354 or 19 per cent. These centers in December, 1925, reported a volume of building construction 15 per cent. greater than for December of the previous year.

Larger gains were revealed in the 25 principal building cities which reported permits issued amounting to $2,761,070,793, a gain of 21 per cent for the year.

New York for the first time in the city's history registered a billion-dollar building year. The value of plans filed

in the five boroughs was $1,030,655,076 compared with $837,661,941, the increase being 23 per cent.

An interesting feature was the report from Florida where the 16 leading cities reported $234,500,437 of permits issued, a gain of 219 per cent over 1924 when the same centers officially permitted $73,-528,991 of building. Miami's gain for the 12 months' period was 267 per cent.

The other outstanding features of the year's developments may be epitomized as follows:

Greatest increase in activity shown in the South where the huge developmental program of Florida and the commercial activity throughout the Southern States were responsible for a 50 per cent. increase over 1924.

An increase of 19 per cent. in the East where the intense activity in the highly prosperous, commercial and industrial area of Greater New York and Northeastern New Jersey accounted for more than half the total.

A substantial, well-distributed gain in the great Central district where the 1924 volume of construction, itself about 2 per cent. below that of 1923, was exceeded by 15 per cent.

In the Pacific West, a recovery of 6 per cent. over 1924 and a return to the 1923 level of building.

The greatest December on record, 15 per cent. above December, 1924, and following four fall months of exceptional activity.

Sufficient volume of building already permitted for or contemplated to give definite assurance of a very high rate of activity for the next several months.

A year of relative stability in building costs, with slight increases in building wages practically offset by moderate declines in the prices of some building materials.

In the building material market, a prospect of firmness with the possibility of price increases.

WHAT IS BEFORE US?

The close of 1925 completed the first quarter of the 20th century. In practically all lines of endeavor it has probably been the most revolutionary quarter century in history.

We who have lived through these twenty-five years have seen the growing use of electricity, the tremendous progress of automobiles, submarines, aeroplanes, radio, etc.

Many of the wonderful chemical and mechanical inventions have been of incalculable value to the building industry —concrete work in winter time is now a common practice.

Despite all talk about shoddy building (and much of it unfortunately is too true) we in the United States are building bigger and better today than ever before in the world's history.

What is in store for us in the next quarter century? If the progress of the first quarter is any criterion, the coming quarter will be a most prodigious one.

As far as construction goes, we are going to build better buildings both in appearance and actual construction. They will be more comfortable to live in and to work in. Perhaps there is no industry that has come so forward as that of the building industry which now stands only second to that of agriculture.

As we stand on the threshold of our new year, we find the prospects for general prosperity in the United States exceedingly bright, and this means of course that the building industry will get its full share.

1925 closed as a most prosperous year for builders. No one ever dreamed we would have over a six billion dollar year. We did. What has once been done can be equalled again.

There is every indication that 1926 will be a very good building year and it will be so even though it does not come up to the 1925 record.

Here and there in different localities there is a slight rumbling of local labor trouble. There is some little demand for a higher wage. In other places there is agitation for a five-day week—it is to be hoped that these ill-advised men will early see the false economic value of creating an artificial labor shortage by such means.

Our manufacturers and supply dealers are prepared to take care of all demands, but to avoid delays due to freight congestion it is well to place orders as far in advance as is reasonably possible. Remember that if everybody places orders at the same time transportation will be choked.

It will be a good slogan to keep in mind for this year—and every other year following—to talk "quality construction" rather than "cheapness," get the thought over to the public that to build well is the cheapest.

Let us strive not only to save by better methods of construction, but by taking better care of our men. Use every means possible to prevent accidents and that means safe methods of building.

Building in general is on a very sound basis and money is easily obtained for any worthwhile project. As in every good thing the shady operator has come into the building game and some slick salesmen are employed to sell mortgage bonds to the public, the total of which is more than the cost of construction of building plus the land! The operators are safe. Builders everywhere should expose and discourage such attempts in their localities. Do not let the public lose confidence in the integrity of the building industry.—*Building Age and National Builder.*

CLEANING A STONE BUILDING WITH STEAM

(Bureau of Standards and Indiana Limestone Quarrymen's Association Cooperate in successful experiment on Baltimore Bank Building.)

The use of steam from a boiler blown directly against the stone through a simple nozzle has been found by the Bureau of Standards, Department of Commerce, to be a very effective way to remove dirt from the walls of a stone building.

To meet the changing demands of present day commercial conditions many old buildings are being altered or remodeled. In order to eliminate the undesirable contrast always present in such cases between the old dirty surfaces and the new stone put in the walls some kind of cleaning of the old portions is generally carried out. Because of the detrimental effects of acid cleaning or sand-blasting, scrubbing with soap powders and hand brushes is customarily employed. This method is effective but slow and laborious, and in an effort to devise a faster and more efficient means of cleaning limestone, experiments with the use of live steam were conducted under the co-operative research program of the Bureau of Standards and the Indiana Limestone Quarrymen's Association, Bedford, Indiana.

An interesting demonstration of this experimental work was the steam cleaning of a remodeled bank building in Baltimore, Md., where the scheme was given a practical trial under commercial conditions. The use of steam at 80 pounds per square inch pressure, the pressure ordinarily used in small portable boilers blown directly against the stone through simple nozzles made of galvanized pipe fitted to the end of ½-inch steam hose lines was found to be very effective in removing the twenty-year accumulation of dirt on this Indiana limestone building. Although the structure was heavily carved and moulded the work was done rapidly with inexperienced labor, the engineer firing the boiler being the only skilled worker on the job. The cost of the job was somewhat higher than a bid received for acid cleaning which was due in part to its experimental character, this being the first complete building ever cleaned with steam. The final color of the stone was not so bright as that of new stone work, but was considered entirely satisfactory since it combined cleanliness with the appearance of age which is usually thought desirable in stone buildings. The successful use of steam in this practical test leads to the conclusion that for the removal of dirt from old limestone buildings, the steam cleaning process would, in most cases, be an economical and effective method to employ with the added advantage that it does not damage the stone.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

You Can Lay Permanently Hard and Waterproof Concrete in Freezing Weather with the Aid of "ANTI-HYDRO"

C. S. Masland Sons' Plant
Carlisle, Pa.

Architects and Engineers, Lockwood, Greene Co.
Contractors, J. S. Rogers Co., Philadelphia

In this carpet factory the concrete floors were both hardened and waterproofed **in one operation** with "ANTI-HYDRO." The floors are so hard that they never dust up and fill the air with gritty dust to settle in the machinery.

"ANTI-HYDRO" has an added value for cold weather work. It lowers the freezing point of concrete and cement mortars to 15 degrees F., making it possible to work during extremely cold weather and finish your contracts on time with prompt payments for completed work.

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. Simply mix it with the gauging water—no skilled labor required. For 21 years "ANTI-HYDRO" has been the accepted standard. Use it on your next job.

As The Editor Sees It

NINETEEN TWENTY-SIX TO BE ANOTHER SIX BILLION DOLLAR BUILDING YEAR

Each year for the past five years The Architectural Forum of New York has conducted an extensive survey among architects and builders to determine the amount of building construction contemplated for the ensuing year. The method used includes the obtaining of confidential reports from thousands of sources covering six geographical divisions of the United States in 19 building classifications. These reports are carefully tabulated and correlated and the totals determined by a careful system of weighting. Thus the final forecast figures are established after months of careful research work.

Each Forum forecast during this five-year period has proven to be amazingly close to the actual figures shown at the end of the year; and in all cases conservative, so that this survey has become recognized as the most authoritative presentation of probable building activity. The allocation of activity throughout the country is an almost certain indication of what will actually take place in the building industry.

Review of 1925 Building Construction

In view of the fact that The Forum Forecast for 1926 indicates another six billion dollar building year, probably equal to the record-breaking activity of 1925, it will be interesting to review briefly the building activity of the year 1925 in order that later comparisons may be clear. The figures for the year 1925 indicate that 6½ billion dollars were spent in the United States.

At the beginning of the year 1925 all conditions indicated that last year would probably equal 1924, which established a record up to that time; but no one anticipated completely the amazing volume to which the building totals have climbed. Records were broken everywhere during 1925.

Everyone connected with or interested in the building construction industry knows of the phenomenal activity which was apparent during the year 1925. Owing to the limitations of space it is not possible to present here the full details of last year's activity, but the great interest of the building fraternity today is expressed in the question, "What will occur in 1926?"

Probable Building Total for 1926

The Architectural Forum has compiled figures received from anticipated expenditures for new buildings during the year 1926, classified according to 19 types of structures and divided into six geographical divisions of the United States. This tabulation shows the amazing total of $5,584,782,500, which will pass over the boards of architects and into actual construction during the year 1926. In addition to this vast sum to be spent for building materials and labor there must be considered the fact that in the small house field and that of industrial construction there is considerable building not developed from architects' plans, probably totaling another half-billion dollars.

Thus it is predicted that 1926 will be another six billion dollar building year with certain changes in the relative proportions of activity in building types and districts as explained in the following paragraphs and tables.

Changes in Public Demand for New Buildings

Each year the grand total of The Forum forecast is broken up into percentage

DRAWING MATERIALS

WITHERSPOON BUILDING PHILADELPHIA
Ornamental Iron

showing the anticipated activity in new building construction for each of the 19 building types in the six established geographical divisions of the United States. By comparing these percentages for 1925 and 1926 it is possible to ascertain the changing public demand for new buildings and to establish for each district the relative activity which may be expected.

The first interesting comparison is to learn what, if any, shifting of public demand has occurred in building requirements for the following six geographical divisions of the United States:

1. Northeastern States, including Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut.

2. North Atlantic States, including New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia.

3. Southeastern States, including Virginia, North Carolina, South Carolina, Georgia, Florida.

4. Southwestern States, including Kentucky, West Virginia, Tennessee, Alabama, Mississippi, Louisiana, Texas, Oklahoma, Arkansas.

5. Middle States, including Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas.

6. Western States, including Montana, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Idaho, Washington, Oregon, California.

The following table shows a comparison of public demand for new buildings in 1925 with that of 1926 for each of the six districts indicated above. In other words a comparison of the relative demand for new buildings in each district for 1926 as compared with 1925. The changes in these percentages forecast the changes of construction activity from a geographical viewpoint.

Public Demand for New Buildings

	Percent. 1925	Percent. 1926
1. Northeastern States	8.4	8.1
2. North Atlantic States	36.3	36.6
3. Southeastern States	3.6	5.9
4. Southwestern States	6.3	6.4
5. Middle States	32.4	31.4
6. Western States	12.9	11.6

The above comparison shows that there will be approximately the same relative building activity in each of the six geographical divisions of the United States during 1926 as compared with 1925, with some decrease in the Northeastern and Middle States and a considerable increase in the Southeastern States (due to activity in Florida).

Character of Anticipated New Building Construction

In the course of the research work involved in establishing this forecast for 1926, The Architectural Forum has had the opportunity to make an interesting series of observations as to the changing character of new building in the United States. The accompanying percentage tables indicate public demand for new buildings; but it may also be noted that the general character of materials and workmanship in buildings is constantly improving.

The high cost of building, together with increased real estate values, has during the past few years provided a forced education for the investing public in this field, indicating the fallacy of poorly considered planning and the use of inferior materials and workmanship. The great effort in the planning of buildings today is to eliminate all waste space and provide a maximum of rental or utility efficiency at the same time attempting definitely to reduce depreciation and maintenance cost through good architectural specifications.

THE VAN SCIVER CORPORATION · SERVICE ·

The ARCH of TRIUMPH PARIS FRANCE

WORLD FAMOUS STRUCTURES

THE Arch of Triumph, Paris, France, is one of the largest triumphal arches in the world. It is one of four arches which Napoleon I intended to erect in commemoration of his victories, and which he began from designs of Chalgrin in 1806, though the work was not completed until 1836.

It is the sincere desire of The Van Sciver Corporation to so co-operate with the builders and contractors of today, that the result of their work will be a lasting credit not only to them, but to this organization as well.

(Continued from Page 68)

learned the lesson of sound building collateral, are insisting upon better construction and upon a serious review of plans and specifications before building and permanent mortgage loans are made.

The total effect of these conditions is reflected in a constant improvement in the character of new buildings and the placing of greatly increased responsibility upon the architectural profession, which to a great extent controls the expenditure of the building dollar.

Thus it is evident that 1926 will not only show a tremendous volume of new building construction, but that these buildings will be in general of better architectural design and better construction.

The American public has learned the lesson of folly in cheap building and poor planning!

Sound Supporting Economic Conditions

A highly important factor in all forecasts of this nature is the background of economic conditions. If business conditions in the United States were not good, with sound promises of so remaining for several years, there might be expected a definite curtailment of building activity—a slowing down of the great momentum established during the past few years. But conditions are good, with definite signs of stability and as the building industry is the indicator of conditions, so with the entire economic situation favorable, there is little fear of a break in public confidence or any basic business change which will interrupt the anticipated program of another six billion dollar building year during 1926.

There is some talk of the building shortage having been met—of rentals coming down—of building again assuming its normal activity. What is a "normal" building year at the present time? Surely it cannot be the pre-war normal. The population of the United States has increased materially since then; the cost of building has increased; the standards of housing American life and business have been raised; the demand for buildings is greater.

The probable "normal" building year of today is four billion dollars or more and on this basis it would take three of four six billion dollar years to meet the still existing shortage!

All is well with the building industry. It is going about its business seriously, contributing to the wealth and comfort of the nation. Some idea of the magnitude and importance of the construction industry may be gained from a statement recently made by Secretary of Labor Davis in which he said: "More than 11,000,000 of our people are dependent for their living upon the construction industry: and 22 per cent. of all the skilled and unskilled labor of the country is engaged in the building branch alone. Some 250,000 freight cars are required to handle the materials. Our building bill is $200 per year for each family in the United States. It is truly the chief barometer of the business of the country. When construction gains, prosperity is with us. It is the great outstanding influence for good or bad in our financial progress."

Architects are busier than ever before—a sure sign of great building activity to come. The number of plans being filed is contantly increasing—another sign of activity.

The Architectural Forum anticipates and predicts that approximately the following number of new structures will be added to the building census of the United States during 1926.

The total number of building permits which will be issued for structures of every kind, including alterations will be approximately 700,000.

There will be constructed in the field of new buildings about:

Automotive Sales and Service Buildings—large	3,174
Automotive Sales and Service Buildings—small	6,740
Private Garages	274,000
Bank Buildings—large	1,320
Bank Buildings—small	4,350
Apartment Buildings—large and small	28,950
Apartment Hotels	1,240
Club and Fraternal Buildings	2,170
Community and Memorial Buildings	1,104
Churches	3,160
Dwellings, under $10,000, including farm	193,000
Dwellings, $10,000 to $20,000	42,000
Dwellings, $20,000 to $50,000	14,700
Dwellings, over $50,000	3,190
Hotels, under 50 rooms	1,874
Hotels, over 50 rooms	1,414
Hospitals	1,117
Industrial Buildings—large and small	9,782
Office Buildings	3,074
Public Buildings	972
Schools, small	2,156
Schools, large	1,742
Stores	7,842
Theatres	1,645
Welfare, Y. M. C. A., K. of C., etc.	670
Farm Buildings, not including dwellings	163,420
Institutions and Libraries	3,634
Total New Buildings for 1926	778,440

STABILIZING BUILDING

How often do we see discredit come to the entire local building industry because some inexperienced and irresponsible so-called contractor bids to do a job at a low price and then is financially unable to carry the contract to completion.

The joint Conference on Construction Practices of the Associated General Contractors of America are doing what they can to correct this evil and are advising the public as follows:

PUBLIC OFFICIALS! Don't let a con-

tract unless you know that the successful bidder has the resources to complete it. Don't let a contract at a price below an intelligent estimate of cost plus a reasonable profit.

SURETY COMPANIES! Don't bond a contractor unless you know he has the experience, financial resources and the physical equipment necessary to fulfill the contract.

EQUIPMENT MANUFACTURERS! Don't sell to irresponsible contractors, and take precautions not to overload any contractor with equipment which he does not need.

CONTRACTORS! Refrain from bidding on contracts which you do not have the equipment or resources to handle. Don't undertake any job at an unprofitable price.—*Building Age and National Builder.*

The Convention and Exhibition Hall at Camden, N. J., was recently dedicated by the Commissioners of the City of Camden at a banquet held at the Convention Hall.

There were about 3,000 people seated in the hall which is an unobstructed room 275x128.

The Commissioners were represented by Mr. M. F. Middleton who made an interesting address.

Senators Edge and Edwards as well as City Solicitor Miller made short addresses complimenting the Commissioners of the City of Camden upon their efforts in procuring the Convention and Exhibition Hall which is larger than any of its kind in nearby cities.

Among those who were especially thanked for their untiring efforts in securing this project were mentioned: Mr. Raymond Staley, Commissioner of Parks and Public Property, Mr. Staley's Assistant, Mr. Denny, who did excellent work, Chief Kelly of the Electrical Bureau, as well as Mr. Harry Pelouze.

Edwards & Green, Architects, of Camden and Philadelphia, were praised for their efficiency in designing and superintending the erection of this building.

John M. Yardley & Son, Builders, Philadelphia, were congratulated upon the workmanship displayed in transforming the former delapidated iron foundry into the beautiful Convention and Exhibition Hall.

PROPER LOCATION OF CHIMNEYS

BY JOHN MC BLAIN

In a development now being marketed there are two apartment houses on the east and one on the west side of a central space allotted to playground and tennis court. The chimneys are on the rear walls, towards the play ground, and the top of each is about 3 ft. above the roof at that point.

In the apartment house on the west side two families on the top floor complained of smelling coal gas last winter. They say if there is no improvement in conditions they will refuse to stay this winter. Representatives of the land company and the architect could find no leaks in the walls and say the complaints are imaginary.

An engineer, an authority of power plant construction was consulted by the tenants. He decided that the fault lies in the chimney height. The architect objects to increasing the chimney height, saying it will hurt the artistic appearance of the group of buildings.

In support of his contention he stated that no complaints were received from tenant-owners in the two buildings on the east side. The three buildings are similar in all respects, having been built from one set of plans. Complaints have come only from two families on the top floor of the west apartment house. The chimney is in the corner of the wall separating their apartments.

The engineer pointed out that the tops of their bedroom windows are only five feet below the top of the chimney; which is on the east wall of a building only 25 ft. wide. The top of the front parapet wall is 2 ft. higher than the top of the chimney. There are two pent houses on roof about 25 ft. apart, rear walls of which are 15 ft. from chimney.

The prevailing winds are from the west and blow over the front parapet wall and the pent houses and around the latter, toward the chimney. The smoke and gases of combustion being heavier than air drop behind the east wall and into the windows. This hypothesis is apparently correct for it is well known that a partial vacuum is created on the leeward side of a building when the wind blows. Unfortunately for the occupants of the upper flats their windows interfere with the formation of the vacuum that would otherwise exist.

The engineer appears likely to win for the tenants. The Building Code Committee of the U. S. Department of Commerce recommends as minimum requirements that chimneys should terminate at least 3 ft. above flat roofs and 2 ft. above peaked roofs. The best practice requires in addition that the chimney top should be one foot higher than any wall or other wind obstruction that is within 15 ft. of the chimney. It also requires that the chimney should at least be as high as any wall or wind obstruction which may be more than 15 ft. and not more than 25 ft. from the chimney. Common sense and experience dictate other modifications with respect to the direction of prevailing winds.—*Building Age.*

PROPERTIES OF CEMENT-LIME MORTARS

An increase in workability and possible reduction in cost are the principal reasons why lime might be used to advantage in cement mortars, according to results secured by the Bureau of Standards, Department of Commerce.

When lime plaster is gaged with cement, it still retains considerable of its former workability, and has gained in strength, while the time of set is reduced.

In this work the Bureau found that when cement paste and lime paste were brought to the same consistency, a much greater percentage of water was required by the lime than by the cement. With this relation holding, the percentages of mixing water in cement mortars and in lime mortars increased with a decrease in the percentage of sand. A cement mortar with lime added requires extra mixing water, but this extra water increases shrinkage possibilities, therefore lime should be limited in cement mortars where it is desired to keep shrinkage low. It is possible to keep shrinkage low by the use of a high percentage of sand in any mortar.

The density of lean cement mortars may be increased by the addition of a small percentage of lime. Where the cement mortar is not richer than 1:2, the addition of lime may result in increasing the strength. The percentages of lime which may result effectively in these respects were found to increase with the leanness of the mortar. It is probable that the lime does more than act as a void filler in lean cement mortars, for it can carbonate and form a binder in the place of the missing cement.

It is not to be expected that these results will be duplicated exactly where other brands of materials or differently graded sands are used with different manipulation and under different storage conditions.

To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of were not taught to battle with the world or unwise educational methods. Such people meet life's emergencies.—Thoreau.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

write practically every form of insurance except life

You Can Lay Permanently Hard and Waterproof Concrete in Freezing Weather with the Aid of "ANTI-HYDRO"

C. S. Masland Sons' Plant, Carlisle, Pa. Architects and Engineers, Lockwood, Greene Co. Contractors, J. S. Rogers Co., Philadelphia

In this carpet factory the concrete floors were both hardened and waterproofed **in one operation** with "ANTI-HYDRO." The floors are so hard that they never dust up and fill the air with gritty dust to settle in the machinery.

"ANTI-HYDRO" has an added value for cold weather work. It lowers the freezing point of concrete and cement mortars to 15 degrees F., making it possible to work during extremely cold weather and finish your contracts on time with prompt payments for completed work.

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. Simply mix it with the gauging water—no skilled labor required. For 21 years "ANTI-HYDRO" has been the accepted standard. Use it on your next job.

As The Editor Sees It

WONDERFUL RESULTS OBTAINED BY INSULATING DWELLINGS

By John R. Livezey

The ability of a material to withstand the test of time for particular purposes is shown in an insulating material. Corkboard, brought on the market about 1893, is now the peer of all other materials used for this purpose, and is the standard where good insulation is desired.

New uses are being found for it, as time goes on—the insulation of machinery to prevent vibration and deadening of sound—and the latest and most important use of corkboard is for the insulation of houses. In the past it has been used in isolated cases for this purpose, and about three years ago, the writer urged an investigation of corkboard for house insulation. Little, however, was done until recently, when investigation brought surprising results as to the great saving in fuel, radiation necessary to heat an insulated house over one not insulated, and the great saving in fuel effected by its use, which is a continual source of income from the investment the whole time the heating plant is in operation.

It has been worked out that the most economical thickness to be used in house insulation is one and one-half inches for walls and two inches for the roof or top ceiling, as the case may be.

One might think that its use would increase the cost of construction so as to make its use prohibitive, but such is not the case; by its use, lath is eliminated, thickness of walls can be reduced, radiation required can be cut 20 to 25%—house plaster can be applied directly to the cork more easily than to lath of any kind at less cost and we have absolute examples where the cost of installation in a house will only be a few hundred dollars more at the outside, and in some cases, the saving in construction is greater by the use of cork.

It will surprise many to know that with all the evidences we have of the great advantage in insulating a house, and the continual saving effected, many builders and steam fitters are skeptical of the matter.

As to the saving on the investment, the amount of fuel used can be cut 25 to 35%. One builds a home and installs many things that are only justified because of their convenience. Few, if any, will actually show a worth-while return on the investment; but with a house insulated with corkboard, the situation is different. It pays an actual return in reduced fuel bills for the heating season.

The amount of savings depends on a number of factors—but in practically all cases it may be said that the insulation of a house, except in warm climates will pay for itself in fuel saved in a comparatively few years.

For illustration, we wish to set before you actual figures, concerning a new residence recently insulated in the vicinity of Philadelphia.

This residence is built entirely of stone, is 2½ stories and approximately 70x40 feet. Due to the unevenness of the walls on the interior, we first had to true up the interior of all exterior walls with Portland Cement Mortar, before applying corkboard. On the interior of all exterior walls we cemented 1½ inches corkboard directly against the walls, using a mix of two parts of sand to one part of Portland Cement Mortar, spread on the corkboard ½ inch thick using approximately 2979 square feet of corkboard. As the attic of this residence is going to be used for storage purposes only, we insulated the underside of the second floor ceiling joist with 2 inch corkboard, nailing same with galvanized iron

WITHERSPOON BUILDING PHILADELPHIA
Ornamental Iron

nails, these being used to prevent rust stains showing through the plaster directly against the joist, using approximately 2478 square feet; in all cases plastering directly against the corkboard.

Due to insulation we wish to give some true and interesting data. To begin with the house uninsulated required 1503 sq. ft. of radiation; due to insulation, it was possible to reduce the radiation 25.6% or 385 sq. ft., to 1118 sq. ft. Although this home is being heated with gas, we figured the savings possible, should the fuel used be oil or coal. For the uninsulated house, 5800 gallons of oil would be required, against 4300 gallons for the insulated house; showing a saving of approximately 1500 gallons of oil per heating season. As for coal, the uninsulated house would require 28.9 tons against 21.5 tons for the insulated house, creating a saving of approximately 7¼ tons of coal per heating season.

Regarding gas, the fuel being used, our calculations show that a house of this type would consume 1,800,000 cubic feet of gas without insulation; due to insulation we find that approximately 1,342,000 cubic feet of gas would be required, or a saving of 450,000 cubic feet at $1.00 per thousand cubic feet or a saving of $458.00 per heating season; the heating season extending from October 15th to May 15th.

In addition to the saving in fuel, we were also in a position to save the owner an additional sum; first, the size of the boiler was decreased, the boiler specified being too large for an insulated house; secondly, the heating contractor reduced the size of the heating units throughout the house; third, owing to the fact that we plaster direct to the corkboard, no plaster lath was required; fourth, as the cork was cemented against the walls, the contractor allowed a credit of the elimination of nailing strips.

Taking into consideration, the allowances made possible due to insulation we firmly believe that the owner in this particular case will be able to pay for the cost of his insulation within two years after he occupies his home.

In addition to what has been included above, for the entire time that this house is occupied, he will have a cooler house in the Summer, and a warmer house in the Winter, with a very small addition to the cost of this house.

The above illustration we believe should satisfy any person that an insulated house is the only modern construction. There are many materials on the market at the present time being used for house insulation purposes, but none of them compare with corkboard. It is slow burning, fire-retardant, and has the approval of the National Board of Fire Underwriters for cold storage construction, and in places where fire has occurred, its peformance has justified this approval many times over. Corkboard is also structurally strong and vermin-proof.

The heat loss through a typical roof consisting of slate laid over wood sheathing (or T. & G. boards) amounts to .42 B. T. U. per square foot. When insulated with one and one-half inches of pure corkboard, the loss is only .14 B. T. U.—a 66% saving. And with two inches of corkboard the reductions amount to 73% —a transmission of but .11 B. T. U.

Could there be more convincing proof that it is high time to stop this awful waste of fuel and in so doing, it will be like finding easy money. There is another point too—the idea of the insulated house is so basically sound and is bound to spread so rapidly within the next few years, that a house without insulation will have a greatly depreciated resale value.

We'll *write* your advertising without charge. All we ask is that you pay for the space and provide our ad. man with the necessary selling pointers.

Bank Building (alts. and add.), Southeast Corner Broad and Diamond streets, Philadelphia. Architect, J. T. Brugger, Public Ledger Building, Philadelphia. Owners, Broad Street National Bank, Lewis A. Davis, on premises. Sketches drawn for addition to building or minor alterations to present building and adjoining building. Work contemplated.

Store and Office, 709-11 Chestnut street, Philadelphia. Architect, J. L. Stetler and H. M. Deysher, 1015 Chestnut street, Philadelphia. Owner, Louis Lifter, Jefferson Building, Philadelphia. Brick, stone, steel, 4 stories, 75x170 feet. Preliminary plans in progress.

Sales and Service Building, Broad and Chelten avenue, Philadelphia. Architect, J. W. Thompson, 703 South Sixtieth street, Philadelphia. Owner, George T. Flurer, care of architect. Brick, limestone, concrete, 3 stories, 60x140 feet, slag roof, plumbing, steam heat, electric light, tile work, hollow metal skylights. Revised plans in progress.

Stores (4), Apartments (6), Northwest Corner Sixty-fifth and Haverford avenue, Philadelphia. Architect, William Lowenthal, 1208 Chestnut street, Philadelphia. Owner, name withheld. Stone, cast stone, 3 stories, 24x125 feet, slag roof, pine and composition floors, incinerator, Murphy door beds, vapor heat, electric light, metal lath, tile and marble work, fire tower. Plans in progress.

Dyeing and Cleaning Establishment, Ridge and Lehigh avenues, Philadelphia. Architect, not yet selected. Owners, Bornot, Inc., care of Frazier Co., 1600 Walnut street, Philadelphia. Site selected.

Store (alts. and add.), Frankford avenue, Philadelphia. Architect, Samuel D. Milnor, 1117 Foulkrod street, Philadelphia. Owner, name withheld. Brick, steel, 1 story, 55x50 feet, slag roof, maple floors, steam heat, electric light, cement. Plans in progress.

Store, Residence and Garage, Frankford, Philadelphia. Architect, Samuel D. Milnor, 1117 Foulkrod street, Philadelphia. Owner, name withheld. Brick, 2 stories, 25x68 feet, 1 story, 17x25 feet, slag roof, pine and cement floors, hot water heat, electric light, tile work, flush bulks, plate glass. Sketches in progress.

Drug Store (alts. and add.), 5622-24 Germantown avenue, Philadelphia. Architect, Edgar A. Wightman, Bankers' Trust Building, Philadelphia. Owner, Martin M. Scott, care of architect. Brick, 1 story, steam heat, tile and marble work, linoleum floors, tile and marble work, metal bulks, plate glass. Plans in progress.

Residence and Garage (14), Pleasant avenue, Germantown, Philadelphia. Architect, private plans. Owner, Charles S. Booth, 4355 Frankford avenue, Philadelphia. Brick, 2 stories and basement, 16x44 feet, slag roof, oak and pine floors, hot water heat, electric light, tile work. Owner ready for bids in a few days.

Apartment House, Green, Hortter street and Upsal street, Philadelphia. Architect, Herman Kline, Bulletin Building, Philadelphia. Owner, name withheld. Brick, steel, 9 stories and basement, irregular in size, built-up roof, oak and pine floors, elevator, vapor heat, electric light, tile and marble work, rolled steel sash, ornamental iron work, electric refrigerator. Architect will soon take bids. Plans completed.

Residence and Garage, Roosevelt Boulevard and Hellerman street, Philadelphia. Architect, E. A. Roth, Drexel Building, Philadelphia. Owner, C. W. Haig, 6512 North Fairhill street, Philadelphia. Stone, 2½ stories, 37x32 feet, tile roof, hardwood floors, hot water heat, electric light, tile and marble work, garage, 1 story, 18x40 feet, cement work. Owner taking sub-bids due as soon as possible.

Apartment House, Sharpnack street, Germantown, Philadelphia. Architect, R. R. Neely, 2301 Spruce street, Philadelphia. Owner, William Bird, 141 East Chelten avenue, Philadelphia. Brick, 2 stories, 20x100 feet, steam heat, electric light, slag roof, hardwood floors, tile work. Plans completed. Owner will take bids.

Residences (50), Ashdale street, Philadelphia. Architect, R. R. Neely, 2301 Spruce street, Philadelphia. Owner, L. B. Roberts, Brookline, Pa. Brick, 2 stories, 16x40 feet, slag roof, hardwood floors, hot water heat, electric light, tile work, garages in basements, enclosed porches, galvanized iron work. Owner ready for sub-bids.

Residence and Garage, Northeast Corner Eighth and Chelten avenue, Philadelphia. Architect, Leopold Hanf, 198 East Essex avenue, Lansdowne, Pa. Owner, Mrs. Alma M. Connor, 2001 North Twenty-third street, Philadelphia. Stone, cut stone, 2½ and 1½ stories and basement, garage, 23x20 feet, house, 42x24 feet, variegated slate roof, oak and pine floors, hot water heat, electric light, metal lath, tile and marble work, ornamental iron work, bluestone, area gratings. Owner taking bids due February 20th.

College Building and Monastery, Fifty-fourth and City Line, Philadelphia. Architect, F. Ferdinand Durang, 1220 Locust street, Philadelphia. Owners, St. Joseph's College, Rev. Albert G. Brown, S. J., president, Seventeenth and Stiles streets, Philadelphia. Local stone, reinforced concrete, steel, fireproof, 2, 3 and 4 stories, 170x186 feet, 150x274 feet, central heat, electric light, tile and marble work, slate roof, hardwood floors and trim, metal casements. Plans may be obtained from architect. Deposit $50 on general construction. Refund $38. Deposit $25 each on plumbing, heating and electric. Refund $20 on each. Bids will be received by Building Committee, care of A. G. Bown, S. J., St. Joseph's College, Eighteenth and Thompson, due February 27th at noon.

Pennsylvania Sesqui-Centennial Building, Philadelphia. Architect, Ralph Benckert, Bellevue Court Building, Philadelphia. Owners, State of Pennsylvania, Harrisburg, Pa., Sesqui-Centennial Commission, H. T. Baxter, secretary, 926 Widener Building, Philadelphia. Plans and specifications may be obtained at office of Ralph B. Benckert, architect, 1418 Walnut street, Philadelphia. Owners taking bids due February 16th at 12 noon on piling and fill only.

Residences (4), Sims street and Forest Hills avenue, North of Overhill street, Philadelphia, $6,500. Architect, private plans. Owner, D. Brewer Gehly, Somerton, Pa. Frame, 3 stories, 31x23 feet, shingle roof, hardwood and pine floors, electric lighting. Permit granted.

Apartment House (alts. and add.), 2111 North Thirty-third street, Philadelphia, $5,000. Architect, private plans. Owner, Benjamin Linker, 204 South Seventh street, Philadelphia. Brick, 3 stories add., 9x15 feet. General alterations. Permit granted.

Residences (15), East side Barclay street, South of Ainslie street, $4,000 each. Architect, private plans. Owner, M. J. McCrudden, 1134 Real Estate Trust Building, Philadelphia. Brick, 2 stories, 16x25 feet, slag roof, pine floors, hot water heat, electric light. Permit granted.

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

Have You Seen It?

Have you seen the boiler with the combustion ring? If you haven't seen it work, then you don't know the saving that the ring (illustrated below) makes in the amount of fuel used and the increased length of the firing period.

The combustion ring surrounds the firepot to a height of 4½ inches above the grates, and it has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-3.

Owner will take bids.

Twin Residences (5 pairs), Ashbourne and Croyden road, Rowland Park, Cheltenham, Pa. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, R. M. Webb, Rowland Park, Cheltenham, Pa. Brick, frame, stucco, 2 stories, 20x34 feet, shingle and tile roof, hardwood floors, hot water heat, electric light, tile work, garages, 10x18 feet each. Owner ready for sub-bids.

Residence, Ashbourne and Croyden roads, Rowland Park, Cheltenham. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, R. M. Webb, Rowland Park, Cheltenham, Pa. Brick, frame, stucco, 2 stories, 24x35 feet, wing 14x14 feet, shingle and tile roof, hardwood floors, hot water heat, electric light, tile work. Owner ready for sub-bids.

Bank (alts. and add.), Lawndale, Pa. Architect, Chrhistian H. Fries, Drexel Building, Philadelphia. Owners, Lawndale Bank & Trust Co., on premises. Brick, limestone, steel, 2 stories add., 47x37 feet, slag roof, cement and pine floors, painting and glazing, steam heat, electric light, metal lath, tile and marble work, ornamental iron work. Architect taking bids due February 15th, 3 P. M.

Store (alts.), Bethlehem, Pa. Architect, H. J. Wiegner, Bethlehem Trust Building, Bethlehem, Pa. Owners, Bush & Bull Corp., 559 Main street, Bethlehem, Pa. Steel work, bronze sash, marble work, leaded glass, hardwood and rubber tile floors, general alterations. Plans in progress.

Hotel Building (add. and alts.), Pittsburgh, Pa. Architects, Webber & Wurster, 1530 Locust street, Philadelphia. Owners, General Forbes Hotel, on premises. General alterations to present building and 13-story addition. Sketches drawn. Plans in progress. Will take bids in about three weeks.

Residence and Three-Car Garage, Haverford road, Ardmore, Pa. Architects, MacKenzie & Wiley, Bankers' Trust Building, Philadelphia. Owner, H. W. Rickabaugh, care of architects. Stone, tile and frame, 2½ stories, 32x45 feet, shingle roof, hardwood floors, hot water heat, electric light, tile work, (3) baths. Plans in progress.

Warehouse, Allentown, Pa. Architect, David Levy, 949 Hamilton street, Allentown, Pa. Owners, Reber, Korn & Co., 219 North Lumber street, Allentown, Pa. Brick, steel, 1 story, 40x100 feet, slag roof, concrete floors (heating reserved), electric light, rolled steel sash, fire doors, garage doors. Plans in progress.

Grade School (add.), Swarthmore, Pa. Architects, MacKenzie & Wiley, Bankers' Trust Building, Philadelphia. Owners, Board of Education, Swarthmore, Pa. Four or five-room additions. Plans (preliminary) in progress. **Details undecided.**

Goodhart Hall, Bryn Mawr College, Bryn Mawr, Pa. Architects, Mellor, Meigs & Howe, 205 South Juniper street, Philadelphia. Owners, Bryn Mawr College, Dr. Marion Edwards Park, president, Bryn Mawr, Pa. Stone, 1 and 2 stories and basement, 108x64 feet, slate roof, steam heat, electric light. Revising plans. Architects will be ready for bids in a few days.

Residence, Richboro, Pa. Architect, Harry Parker, 1120 Locust street, Philadelphia. Owner, name withheld. Stone, 2½ stories, slate roof. Plans in progress.

Apartment House, Northampton, Pa. Architect, H. J. Wiegner, Bethlehem Trust Building, Bethlehem, Pa. Owner, Adam Brucher, Jr., 735 Main street, Northampton, Pa. Frame, 3 stories, 45x70 feet, slate roof, hardwood floors, vapor vacuum heat, electric light, tile work. Architect will be ready for bids the first of the week.

Residence and Garage, Newtown Square, Pa. Architects, MacKenzie & Wiley, Bankers' Trust Building, Philadelphia. Owner, Casper Bongiovanni, Merion, Pa. Stone, 2½ stories, 32x45 feet, garage 25x35 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress. Owner will build.

Residence, Nazareth, Pa. Architect, H. J. Wiegner, Bethlehem Trust Building, Bethlehem, Pa. Owner, David Koch, Nazareth, Pa. Brick, 2 stories, 24x30 feet, slate roof, hardwood floors, hot water heat, electric light. Architect taking bids due in two weeks.

Moving Picture Theatre, Store and Apartment, Garrett, East of Market street, Drexel Hill, Pa. Architect, not yet selected. Owner, Herbert Effinger, 1631 West Ruscomb street, Philadelphia. Size of lot 130x136 feet, 300 feet, irregular. Work contemplated.

Church (add.), Cedar lane and West Chester pike, Highland Park. Owners, Holy Sacrament Episcopal Church, Rev. George Barnes, Highland Park, Pa. Stone. Work contemplated.

Road Work, Pennsylvania. Owners, State Department of Highways, Harrisburg, Pa. Owners taking bids due March 2nd at 10 A. M.

Beaver County, R-538, Section 2, Hanover and Green Townships, 28,913 feet. One course reinforced concrete. Certified check, $3,500.

Bedford County, R-356, A-2816-3363, Londonderry Township, 26,658 feet. One course reinforced concrete. Certified check, $3,500.

Bradford County, R-241, Sec. 4, Wyalusing Borough, Wyalusing, Standing Stone Townships, 36,436 feet. One course reinforced concrete. Certified check $4,000.

Cambria County, R--234, A-3577-3923, Sec. 1, Reade Township, 19,461 feet. One course reinforced concrete. Certified check $3,000.

Crawford County, R-447, A-3819, Summit and Sadsbury Townships, 11,565 feet. Either bituminous wearing surface on a concrete base or one course reinforced concrete. Certified check $2,500.

Dauphin County, R-140, A-3689, West Hanover and East Hanover Townships, 14,610 feet. One course reinforced concrete. Certified check $2,500.

Delaware County, A-133, Sec. 5, Haverford Township, 10,797 feet. One course reinforced concrete. Certified check $2,500.

Jefferson and Clearfield Counties, R-59, A-3525-3526-3794, Sandy and Washington Townships, Falls Creek Borough, 9,679 feet. One course reinforced concrete. Certified check $2,000.

Lehigh County, R-175, Whitehall and North Whitehall Townships, 15,657 feet. One course reinforced concrete. Certified check $2,500.

Montour County, R-182-240, A-3765, Danville Borough, 4,458 feet. One course reinforced concrete. Certified check $1,500.

Schuylkill County, R-161, Sec. 2, Frackville, Gilberton Boroughs, West Mahanoy Township, 8,719 feet. One course reinforced concrete and vitrified brick pavement. Certified check $2,000.

Somerset County, R-50, A-3137-A, Lower Turkeyfoot Township and Confluence Borough, 8,137 feet. One course reinforced concrete. Certified check $2,000.

Washington County, R-242, Sec. 3, A-3703-3617, West Middleton Borough, Hopewell and Canton Townships, 32,360 feet. One course reinforced concrete. Certified check $4,000.

WHAT FIRE DOES TO AMERICAN FARMS

Next to the rustic conception of Mr. Wall Street as a frock-coated, silk-hatted rotundity mouthing a banded perfecto and toying with a cable-like watch-chain, probably no popular fancy is so far removed from reality as the city man's picture of the American farmer. Him the urbanite sees as a lank and unkempt figure garbed in soiled overalls, and chewing reflectively on a wisp of hay the while he listlessly scrapes the tynes of a pitchfork.

Preposterous to the nth degree are both visualizations. The farmer of today is an alert, progressive business-man. He lives and moves in an environment that has been modernized by the introduction of the automobile, the stationary gasolene engine and the telephone. His house is lit by electricity. He "listens in" on the radio and attends the movies; and there are sundry other devices and conveniences which he shares with the city dweller.

Going the rounds at the moment, it so happens, is a certain bucolic ballad which employs as a refrain the sentiment that "old Farmer Gray took another load away." The song is comical enough and is intended to be characteristic of American rusticity. That pretention, however,

is the funniest thing about it; for as a matter of fact whenever "Farmer Gray" or any of his neighbors does have occasion nowadays to transport fodder, it is a hundred to one bet that he loads it abaft the purring motor of a 4-ton truck. "Wal, I swan," as an expression of farmerdom, if it ever did pass current far from the madding crowd, has given way in recent years to "Put in another ten gallons—and make it snappy." No, it is a case now of *urbe in rus*.

All of which is by way of re-stating what has been noticed often recently—that farm life in the past few years has been enormously broadened and quickened and, generally speaking, greatly improved; improved, that is, in all material respects save in the vital one of fire-safety.

The truth is that both the city man and the farmer are modern in outlook and in methods, the one as much as the other, and more than one present-day problem they face in common. Of these none more urgently demands their solution than that of fire reduction. Circumstances naturally have forced the city man ahead of his country relative in the taking of preventive measures against fire and its ravages; but the ruralite can afford no longer to lag behind. Just why this is so appears in the facts pertaining to farm life loss.

A Farm Fire Every 15 *Minutes*

And what are these facts? Well, the first, the most significant and the most undeniable is that valuable farm property, scattered throughout the length and breadth of the country, is subjected to attack by the flames every quarter of an hour throughout the year. This is speaking, of course, upon the basis of averages; and let it be emphasized: *every quarter of an hour.*

In the five-year period from 1919 to 1923 the amount of the farm fire loss, as recorded by the Actuarial Bureau of The National Board of Fire Underwriters, reached a total of $141,157,930, or $386,734 a day. This figure represents the aggregate derived from 203,262 insurance claims and probably should be increased by 25% to allow for unreported and uninsured losses, of which this occupancy shows somewhat more than the usual number.

But even $141,157,930 is a sufficiently staggering and deplorable wastage. It means that the loss, if apportioned equally among all claims, would have reached $694, which is high for a classification of this character, where the average value, including land, buildings and machinery, is only about $10,000. Since, moreover, there are slightly less than six and one-half million farms in the United States, it is evident that one in every thirty-two had more or less disastrous experience with fire in these five years. Or, to phrase it otherwise, the number of loss claims for the whole country greatly exceeded the number of farms in the New England States. And this experience three-fourths of these farms need not have had, for the reason that carelessness and lack of knowledge of fire hazards, but principally the former, were chiefly responsible.

Lightning Leads

Leading all other causes of fire in American farmsteads during the five-year period under review was *Lightning*. From this element exactly $20,373,360 destruction was recorded from 1919 to 1923. This constitutes 14½% of the total farm fire loss.

For a number of years now, in fact ever since Actuarial Bureau records have been kept, *Lightning* has led all the causes of farm fires. Not yet, apparently, has the farmer's deep-rooted mistrust of the efficacy of rodding been overcome. In what may be called the early years: that is, in the era of the dishonest lightning-rod agent, much misinformation was broadcast throughout the length and breadth of rural America concerning the value of this means for averting lightning damage.

But with standard, approved equipment, such as is available today, and with knowledge of effectual installation easily obtained, it seems high time that the old impression were removed. Certainly, the up-to-date farmer rods his buildings, for by so doing he renders them practically immune to harmful visitation from the sky.

Second to *Lightning* as a farm fire hazard—almost, indeed, a "runner-up"—was *Defective Chimneys and Flues*. This factor inflicted damage amounting to $18,935,956, which represents 13½% of the total loss in this occupancy and provides definite evidence of the fact that in rural districts chimney construction and upkeep are flagrantly and notoriously bad. It is, moreover, to be noted that since 1919 a yearly rise of several hundred thousand dollars has been recorded in the loss total from this cause, indicating that farmers will be well repaid for giving to this hazard much earnest study.

It is a peculiarity of blazes originating in a flue or chimney that, the defect often being concealed, the flames sometimes gain great headway before being detected. "The fire," reads a characteristic report of a defective chimney blaze, "was not discovered until nearly the entire roof was in flames and the family was forced to rush to safety with scant opportunity to save the contents of the farm house." Hundreds of examples of defective flue and chimney fires might be instanced here as evidence of the insidious quality in fires of this kind. The problem of fire-safety on the farm hardly can begin to be attacked until sound chimneys erected on solid bases shall become the rule instead of the exception they are today.

Closely related to *Defective Chimneys and Flues* as an originating cause of fire in agricultural districts, and responsible for more than 8% of the total destruction was *Sparks on Roofs*. Against this hazard there was entered in the five-year period a loss of $11,433,751, every dollar being needlessly sacrificed, since *Sparks on Roofs,* as well as *Defective Chimneys and Flues,* is a wholly preventable hazard.

Matches-Smoking, fourth in importance among the fire hazards, inflicted $8,508,667 damage during the sixty months of 1919-1923. Of the total farm loss, slightly more than 6% was attributed to carelessness with matches and smoking materials. So often are the results of this type of unheed brought home to everyone through the medium of the newspapers and by personal observation, and so easily correctible is it by the exercise of plain common sense, that not the smallest excuse remains for *Matches-Smoking* taking the toll it did—and does—from American farm properties.

Barns Are the Seat of Greatest Danger

It is, of course, evident that the principal seat of fire danger on the farm is the barn. This is so not only because of its usually light frame construction, the hazard of *Open Lights* and the use of matches and smoking materials in close proximity to readily burnable contents, but because much of the produce stored therein is subject to spontaneous ignition. How real this danger is may be judged by the loss ascribed to *Spontaneous Combustion,* $7,130,158 which places it fifth among the fire causes, with a percentage of 5. Today *Spontaneous Combustion,* a partly preventable cause, holds fourth place after *Matches-Smoking* in point of culpability for the total American fire loss, which is sufficient to draw to it the attention of every rural resident of America.

Petroleum and Its Products stood sixth among all the known causes in farm occupancy and this again is one entirely avoidable, the introduction of the gasolene motor in its many forms being, of course, responsible. It taxed the country's farmers $6,247,154 in the five years ended with 1923.

Farm property destruction almost equal in extent to that occasioned by *Petroleum and Its Products* was attributed during the five-year period to *Stoves, Furnaces, Boilers and Their Pipes,* the exact amount being $5,998,413. This, again, is a hazard which can be overcome by the taking of ordinary precautions, such as the shielding of walls and flooring about heating appliances and the wrapping of tri-

butary pipes with suitable incombustible covering.

Another fire risk on the farm may be the incubator that is allowed to become overheated. Brooder lamps often are lit and placed in the chamber without careful inspection to see that the wick is turned to the right height. One farm woman who was guilty of this form of negligence was summoned by smoke and the cries of alarmed young chicks just in time to extinguish what, in five minutes more, might have reached the proportions of a serious communicating fire, for the brooder room adjoined the rear of the dwelling—in itself a structural defect.

Open Fires obviously are dangerous when left unscreened. *Hot ashes and Coals, Open Fires* also caused much damage to farm property in 1919-1923, because care was not taken with them. *Incendiarism and Arson* were present, too, as factors of farm destruction, as nearly $800,000 was lost due to the application of the torch.—*Safeguarding America Against Fire.*

The annual banquet of the Philadelphia Builders' Exchange and Employers' Association will be held at the auditorium of the Manufacturers' Club Thursday evening, February 11, at 7 o'clock.

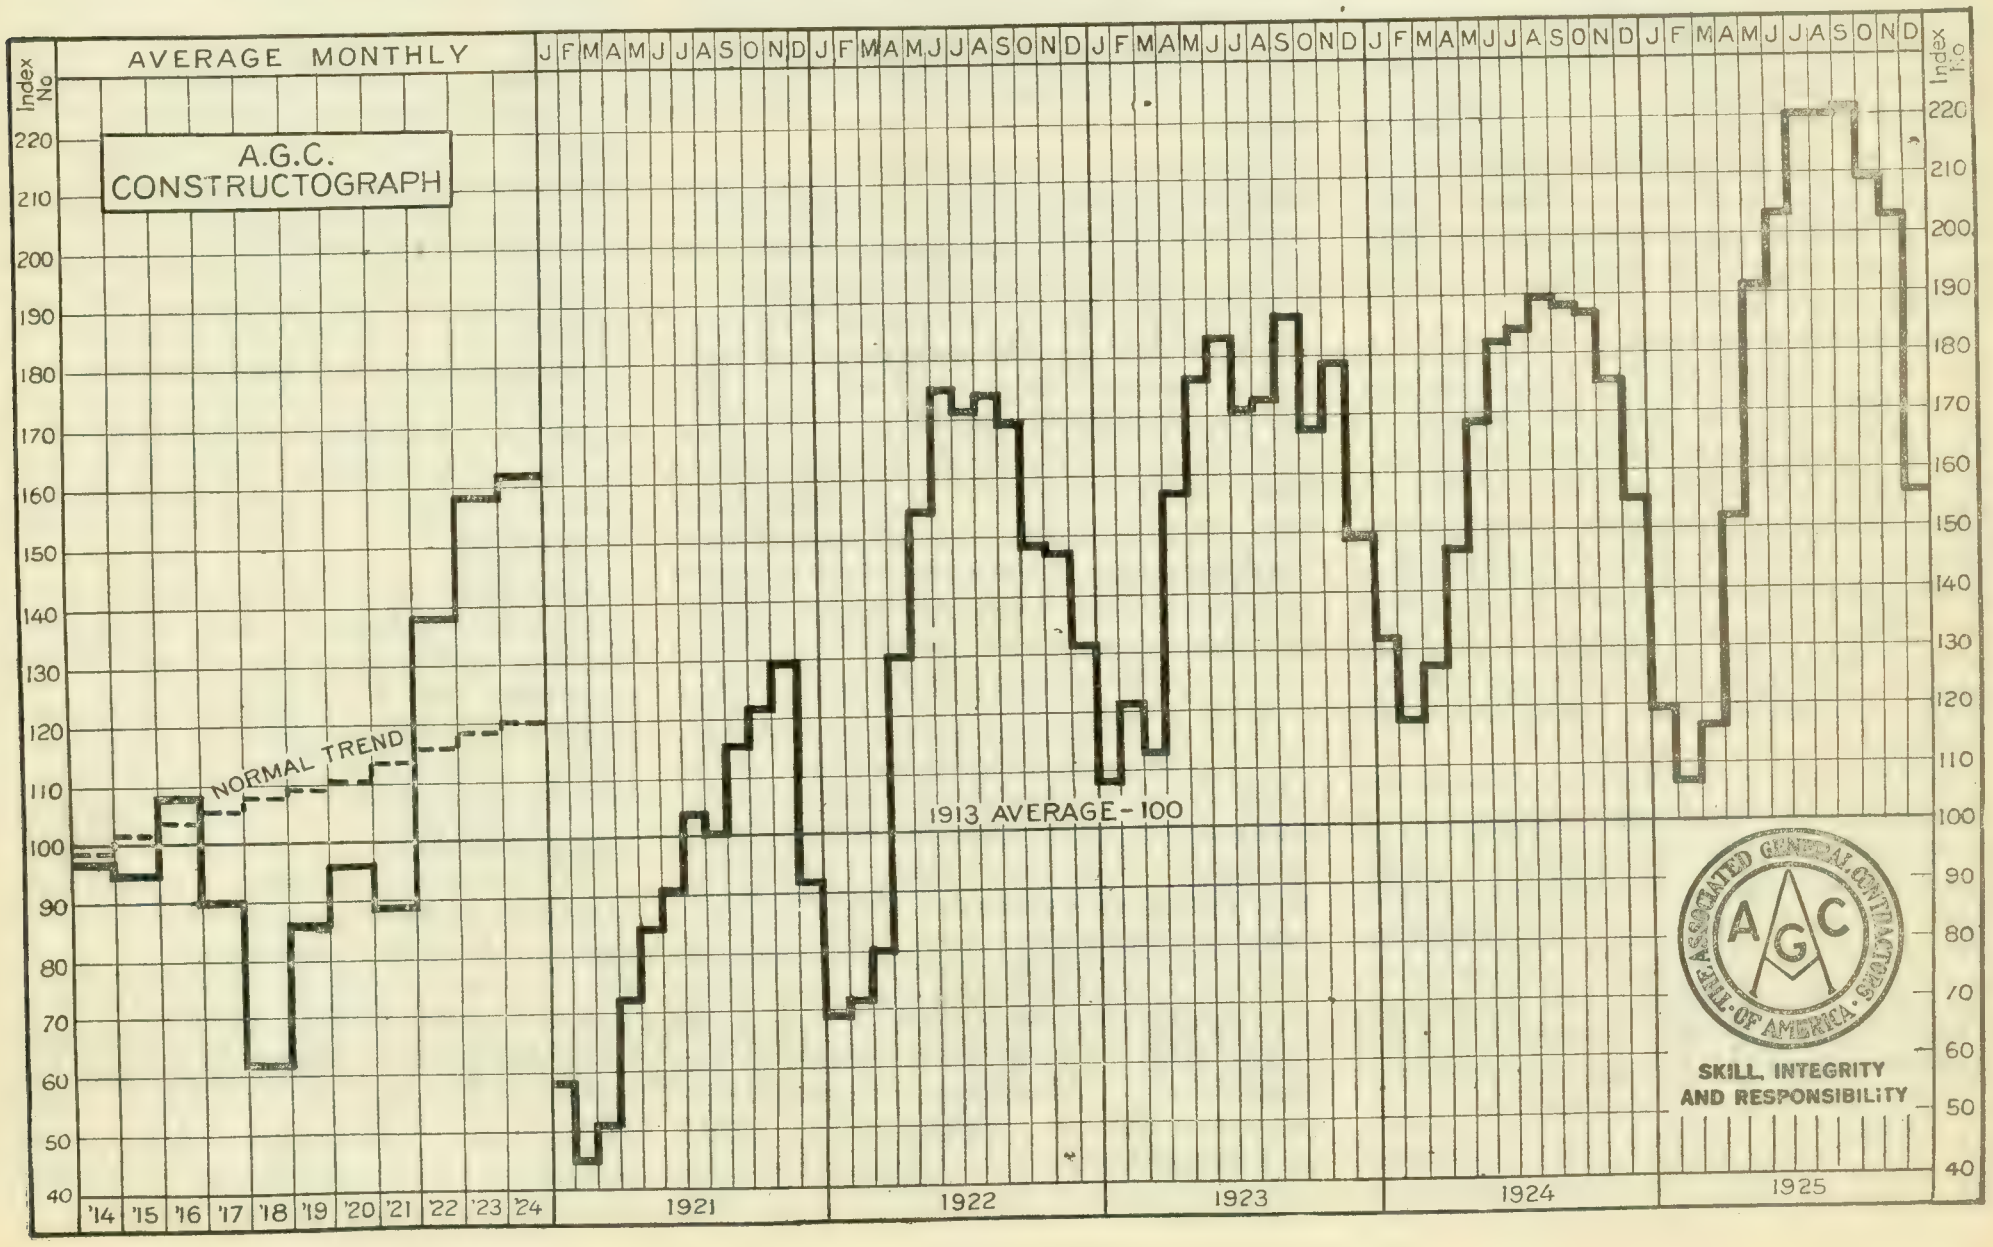
Judge Robert Carey will be the speaker, and most likely his subject will be "Guilty or Not Guilty."

Building costs will be more inclined to seek lower levels than to mount during 926, according to indications drawn from statistics just compiled by the Associated General Contractors of America. Whether the downward tendency of these costs, manifested perceptibly in 925, will continue depends upon wage scales that will prevail during the coming year, the experts declare.

It is pointed out that costs dropped during 1925 to the lowest mark they had held in three years, and this despite the fact that the year saw all existing records for volume of construction broken. During this period, the average of wages paid in the construction industry showed practically no change.

A study of the newly-compiled statistics shows the average of prices paid by general contractors for the basic building materials was four per cent. lower in December than during the opening months of 1925.

With the housing situation fairly well met in many sections of the country, expectation that a decline in speculative building operations will put in its appearance during 1926 is being expressed. This anticipation, coupled with the growing conservative attitude of industry in general, leads to the conclusion that 1925 will stand as the peak year.



Success in the campaign for increase of construction operations during the winter months is shown by the December figures which topped all marks for volume of construction set by that month in previous years.

The volume of construction in 1925 was approximately 8 per cent. greater than that in 1924, the next highest mark in the history of the country.

The total volume of contracts awarded during the first eleven months of 1925 exceeded by 23 per cent. the total volume awarded during the corresponding period of 1924, the contractors' survey shows. While the volume recorded for November was 8 per cent. smaller than that shown in October, it exceeded the November, 1924, volume of awards by 21 per cent.

The volume of building permits issued in 20 principal cities during November was 9 per cent. smaller than the October figure. The volume of permits issued during the first eleven months of 1925 was 17 per cent. greater than the volume for the corresponding period of 1924.

Awards for concrete surface pavements during November totaled 3,500,000 square yards, 1,700,000 square yards of the total representing road pavement, with surfacing of streets and alleys supplying the remainder. The volume of concrete surface pavement awards for the first eleven months of 1925 exceeded by 17 per cent the total volume awarded during the corresponding period of 1924.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

"ANTI-HYDRO" Keeps the Concrete Pits Dry in this "Spearmint" Factory

The concrete pits in this new Wrigley plant are permanently waterproofed with "ANTI-HYDRO," and as a result, they are always dry.

A one-inch cement plaster coat mixed with "ANTI-HYDRO" when applied on the inside of pits, walls and foundations keeps them absolutely dry against any head of water.

"ANTI-HYDRO" is extremely easy and economical to use. It is a liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. It accelerates the set of cement and so enriches the concrete that the finishers' time is reduced to a minimum.

For 21 years "ANTI-HYDRO" has proved its economy and satisfaction on every type of hardening and waterproofing work. Use it on your next job.

As The Editor Sees It

REASONS FOR CRACKS IN PLASTER EXPLAINED TO HOME BUILDERS

Acquaintance with disfiguring plaster cracks has been so general that it is often accepted as an inevitable fault which develops as a home ages. This is one of the misconceptions which has been corrected by the National Campaign for Better Plastering, sponsored by the National Council for Better Plastering. And there is developing an increased interest in the things which cause plaster cracks and means of preventing them.

In response to this increased curiosity concerning plaster, "The Small Home," the magazine of the Architects Small House Service Bureau, published an article entitled "Forty Reasons Why Walls and Ceilings Crack." It will be of interest to every architect and builder showing, as it does, how knowledge which formerly was known only by those identified with the building industry is being carried to laymen. The article says in part:

"Everyone is familiar with cracked walls and ceilings. Sometimes the reasons for the cracks are evident to everyone, but at others the reasons are not so plain to be seen. Sometimes the materials used are thought to be at fault when the real underlying cause of failure is that good materials have been used too sparingly or in a wrong manner. The best materials in the world, used without taking into consideration the limits of their strength, or not put together in ways tried and proven, will not give complete satisfaction.

"It is unfortunately true that thousands of small homes have been built which, in a comparatively short time, will deteriorate outrageously. It is a waste of money to use good materials in an unwise way. The Jerry builder who puts these materials together so that they do not stay put is really either making you the victim of his ignorance or is indulging, at your expense, in a form of legalized robbery."

Following are some of the reasons why walls and ceilings crack: Building a house on a fill; failure to make the footings wide enough; failure to carry the footings below the frost line; width of footings not made proportional to the loads they carry; posts in the basement not provided with separate footings; failure to provide a base raised above the basement floor line for the setting of wooden posts.

Not enough cement used in the concrete; dirty sand or gravel used in the concrete; failure to protect beams and sills from rotting through dampness; setting floor joists one end on masonry and the other on wood; wooden beams used to support masonry over openings; mortar, plaster, or concrete work allowed to freeze before setting; braces omitted in wooden walls.

Sheathing omitted in wooden walls (excepting in back plastered, metal lath, construction); drainage water from roof not carried away from foundations; floor joists too light; floor joists not bridged; supporting posts too small; cross-beams too light; sub-flooring omitted; wooden walls not framed so as to equalize shrinkage.

Poor materials used in plaster, plaster applied too thin; lath placed too close together; lath run behind studs at corners; metal reinforcement omitted on plaster at corners; metal reinforcement omitted where wooden walls join masonry.

Metal lath omitted on wide expanses of ceiling; plaster applied directly on masonry at chimney stack; plaster applied on lath that are too dry.

Too much cement in the stucco; stucco not kept wet until set; sub-soil drainage

RANGES AND COOKING EQUIPMENT

BY THOMAS B. HUNTER

Hunter & Hunter, Consulting Engineers

In designing a home, we all appreciate that the modern kitchen is quite as important as any room in the house. We all recognize that it must be clean, the cooking apparatus must be convenient and labor-saving. Cooking must be safe, dependable, healthful and easily controlled with a minimum of effort. What fuel best meets these requirements?

All domestic science classes of high schools and cooking schools, or nearly all; the kitchen departments conducted for exprimental purposes by the *Ladies Home Journal* and other recognized national authorities; the hotels, hospitals and restaurants—wherever good cookery is the first essential—use gas ranges.

Let us accept, then, that gas is an ideal fuel for use in the small home kitchen; that it is not only a scientific way, but a cleanly and economical way, to prepare food. We come, then, to the question of how the designer of a home should go about it to assure that the occupants of that home may have the advantage of the most modern cooking, water and house heating methods. Many architects are giving as much thought to the kitchens they build as to any other part of the house, and some carry it so far as the specifiying of the proper type of range and heater to be used.

In this connection, a friend remarked to me not long ago: "Why my kitchen is the most pleasant room in my house—and the most sensible. With its tiled sink drains, immaculate floor, enameled walls and convenient modern fixtures, and its spick and span enameled gas range, an oven which makes it unnecessary to stoop; thermostatic control so that a complete and appetizing meal may be prepared and left to cook automatically while we entertain company or go for a ride, it is a model of efficiency.

"You professional men who have to do with building ought to insist on every home you build nowadays having these conveniences. They are no longer luxuries or experiments; they are necessities."

It cannot be denied, then, that we should give some thought to the provisions we make for our kitchens and their equipment. In the case of gas ranges, the minimum flue area for the vent should be four inches in diameter. It is better practice to provide a flue at least six inches in diameter in order to allow for the incinerator's use at the same time all of the range burners may be turned on. When a battery of ranges make use of a common flue, as in an apartment house, the total area provided should be the equivalent of at least four inches in diameter for each range. Six inches is better.

Not only is the size of the flue important, but the flue outlet should be brought to the proper height above the roof. In every case, this height should be great enough to eliminate down draughts entirely. It should be higher than the highest point of the roof. There should be no deviation from this rule and yet an investigation would surprise you, for you would find that these important rules are violated almost every day.

In designing the kitchen, the range should be so placed that the lighting comes from either the right or the left. It is not necessary that a vented hood be installed to carry off the cooking odors and prevent them from penetrating the living rooms of the house, over a gas range. With a gas range, however, it is

(Continued from page 100)

practical to dispose of cooking odors by preparing odorous foods in the closed thermostatically-controlled oven.

Many of the newer kitchens of the most popular type provide a transom installed just above the windows over the kitchen sink, where it serves the double purpose of affording additional direct daylight and permitting ventilation of the inside area without opening windows and doors, with their attendant draughts.

In planning the truly efficient kitchen, the range should be adjacent to, or directly opposite the kitchen cabinets. An ideal arrangement where two cabinets are provided, is to place the range between them and opposite the sink. The minimum space to be allowed for a gas range is 36x52 inches.

It is not the purpose of the writer of this article to say that this trade-marked brand or that trademarked brand of range is better than another. An infinite variety of satisfactory gas appliances of all kinds for all purposes is now available. But it can not be too strongly insisted that the best type of gas range is that which is provided with lids and a covered top. The greater economy, more uniform heat, use of a single burner to supply heat to the entire top surface of the stove, convince us that this is the best of the many excellent ranges now offered.

There has been rapid development in design and construction of gas appliances generally so there is a model now available for every conceivable kitchen duty. Many of them are provided with garbage incinerators: All are designed to occupy the most compact space. The better ones are beautifully enameled and designed to make the kitchen a spot of brightness and cheerfulness, instead of a place of drudgery.

The advantages of the modern enameled range with its covered, uniformly heated top, its incinerator for the quick and easy disposal of garbage, its 32-inch high oven, its ease of regulation, its automatic thermostat control, are too numerous to be ignored in any consideration of the modern kitchen—the most-used room in the house.

It will be the greatest advantage to all concerned if the client will determine not only the kind of fuel to be used but the type and size of the range to be installed before the plans are drawn. The real reason many minsconceptions regarding the use of gas and a failure to appreciate its healthfulness have been permitted to grow up in some quarters can almost always be traced to a failure on the part of the designer to provide adequate vents and flues.

The flue is all-imoprtant. The minimum diameter for any gas range flue should never be less than four inches, six is better and the top of the flue above the roof should never be lower than any part of the roof. Where patented chimneys, installed in short length, are used, it should be insisted that the joints be closed tightly. Where the rectangular shapes of this type of flue are used the cross sectiona area should be slightly greater than the ardea of the circular ones given, to assure adequate capacity for carrying off exhaust gases.

Where there is an instantaneous, or storage, water heater, additional flue space invariably should be provided but, of that more in the next article of this series, when water heaters will be discussed.—*The Pacific Coast Architect.*

COMPETITION

When contractors, either in small or large groups, get together, the question of cut-throat competition is inevitably bound to come up for discussion. Ordinarily, those in the construction industry are prone to believe that this pernicious practice is confined solely to the building business. This, however, is not the case if we are to believe Judge E. H. Gary of the U. S. Steel Corp., who recently stated that the reason capital invested in the steel industry did not return a fair and reasonable profit was due to the fact that manufacturers, in their endeavor to secure more than their share of business, have carried competition to the point of accepting unreasonably low prices for their commodities.

In urging that this practice be discontinued Judge Gary said, "Our government, and our customers, would have more respect for us if we always insisted upon fair and reasonable prices, never less, never more. Business conducted on sound, logical, moral and legal principles will receive the approval of right-minded people of all classes."

What applies to the steel industry applies in an even greater degree to the construction industry. During the past few years we have been witnessing an unprecedented period of activity in the building industry. Every contractor, from the small housebuilder to the largest of the national general contracting firms, has been busy. There has been plenty of work for every one, yet the utter disregard for legitimate profits in many instances would indicate just the reverse.

Every contractor, large or small, should adopt a hard and fast rule to the effect that he is entitled to a reasonable profit on every operation. The rule once made should be adhered to in every instance. There is no glory in work done at a loss and there is certainly no financial gain.

—The Contractor.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

AMERICAN FARM HOMES TO BE DISSECTED FOR IMPROVEMENT STUDY

How to Bring Urban Conveniences to Rural Home to be Subject of Conference

When labor saving devices were first designed the needs of the rural home were not considered. Sanitation has nearly always considered the city first. Heat-

ing, plumbing, lighting and housekeeping facilities have heretofore been designed with the city user pictured as the main sales prospect. So also the work of most of our architects has been largely confined to the design of homes for the man in town.

This concentration upon the urban dweller has brought about a neglect of the farm home. How to overcome this resulting backwardness and bring to the rural home the conveniences of the average city home owner will be the subject of a meeting of the Better Farms Homes Conference to be held in the Hotel Sherman, Chicago, February 18 and 19, 1926.

The object of this conference will be a general dissection of rural home conditions and discussion of ways and means of bringing more architects into the rural building field, thus insuring more comfortable, better planned homes. Labor saving devices for lessening the work of the woman on the farm will be studied and changes necessary to adapt them to the farm recommended.

This conference is the outgrowth of years of effort on the part of the Division of Farm Structures of the American Society of Agricultural Engineers of which F. A. Wirt of Racine, Wis., is president and Professor D. G. Carter of the University of Arkansas, chairman of the Division of Farm Structures.

Architects to Co-operate

Wm. Draper Brinckloe, of Easton, Md., one of America's most prominent architects and himself a farmer will attend the conference and will present the results of his years of study in planning better farm homes.

Another subject which will be discussed at the meeting will be: "What the farm woman wants her rural home to be." The point of view of the woman on the farm will be presented by a prominent farm woman.

It is stated that more than 60 organizations are behind this movement which is heralded as the greatest forward advance in farm living conditions yet made. The Architects' Small House Service Bureau, the Sears-Roebuck Agricultural Foundation, the U. S. Department of Agriculture, American Federation of Woman's Clubs, and the American Public Health Association are only a few of the many associations which will take part in the conference.

For the benefit of the hundreds of thousands of interested rural folk who will be unable to attend the conference, the banquet program and many of the discussions occuring in the meetings will be broadcast over the radio. It is stated that the conference hopes to make the meeting an annual gathering to promote the general betterment of conditions on America's farms.

THE ARCHITECTS' INFLUENCE FOR BETTER PLASTERING

Under the guidance of the architect and the hand of the astisan more true architecture can be produced with plaster than any other material chosen as a medium of expression. Although it is one of the ancient materials, it is only during late years that the American architect has realized its many uses. Even so, there is very much room for improvement in plastering.

In sunny lands, as Florida and California, the art of plastering is more highly developed than in the North and East. Those parts of the country have houses of Spanish or Italian architecture, largely of stucco or exterior plastering. In interior plastering the use of colored and textured plaster is also more prevalent in the extreme South and West. However, spurred on by the Better Plastering Campaign, the North and East are appreciaing colored and textured plaster more.

The architect, to popularize textured plaster, must provide a good plaster foundation and must make allowances in the cost for good artisans and materials for that purpose. The plastering contract is too often considered on price alone and is let with the general contract to the lowest bidder, when it is well known that no contract depends so much upon the integrity of the sub-contractor and his willingness to put more hours of labor and more materials into his work.

Why do we not, therefore, face the question fairly? Plastering is not the operation on which to save money. It represents about ten per cent. of the total cost. If ten per cent. saving is made on plastering only one per cent is deducted from the total cost of the structure. Yet in that small item lies eighty per cent. of the appearance of the interior and all the chance for permanence of the plastered wall and ceiling. We can approve discoloration, cracks and exposed background in the exterior, when it is truthfully done to represent age, but even the most appreciative American housewife would not tolerate Michael Angelo's frescoes in the Sistine Chapel in their present condition. For the American housewife the wood may be split and antiqued, but the plaster must be unstained and uncracked.

It is for the American architect to so guide the client that sufficient money is allowed in the contract for careful, intelligent workmanship and permanent materials.

JURISDICTIONAL DISPUTES

Address of James J. Davis, secretary of labor, before the National Board for Jurisdictional Awards in the building trades, at the offices of the American Federation of Labor, in an open meeting attended by representatives of the building industry, architects, contractors, and officials of building trades and labor organizations.

I appreciate your courtesy in inviting me to this important meeting of representatives of the building industry of the country. On the matter of jurisdictional disputes I have strong convictions and shall open my mind freely. As you know, I am a plain blunt puddler of the mills, and I am going to talk to you frankly this morning on the effect these disputes have on building program of the entire country. In some instances it is more than a jurisdictional dispute—it's civil war between contending organizations.

I am interested in the National Board of Jurisdictional Awards. I am interested in it for a number of good reasons. And I am warmly interested.

As I see it and from information I gather, it is a representative organization. It represents every party and all parties to a jurisdictional dispute. If all parties are not in, there is plenty of room for them to get in. I am interested in this Board because it was suggested by labor and its beginings were started by John B. Lennon, a commissioner of conciliation who was directed to do so by the then Secretary of Labor. That was in 1918. This Board has settled hundreds of these jurisdictional disputes since then, and has saved millions and millions of dollars for the American people. The whole country is interested in this Board. The need of this Board is plain to all. The whole country looks to it to save the building industry, one of the biggest industries we have, from being shot to pieces by these jurisdictional disputes. Why shouldn't we have peace in this industry, when it isn't a question of whether union labor shall have the job, but which union shall have the job?

Reading the reports of my predecessor in office, I learn that in forming this Board, Commissioner Lennon got the enthusiastic approval of architects, builders, and men of the building trades in the American Federation of Labor. The thing was a success from the start. Conferences were held in New York, Chicago, St. Louis, and other large cities of this country. The idea was to get some standardization of craft work, and progress was immediate. This Board took formal shape in 1919. As I say, in six years it has saved the country untold

millions in the disputes it has settled. That is progress. But these disputes go right on. This Board has plenty of work yet to do. Plenty of progress remains to be made.

Some building trades have accepted the awards of this Board. Others have not come along. That means that every encouragement must be given to extending the activities of this Board of Awards. All parties should abide by its decisions. This is no "star chamber" outfit. All parties are represented here. And parties have a chance here to get up and say their say. And when an award has been handed down here, all parties should accept that award and carry it out.

I don't know of anything more disheartening to a workman than to set out in the morning not knowing whether or not he is going to get a day's pay, because one of these jurisdictional disputes may be on; I don't know of anything so disheartening to the owner of a building, the man who is paying for it, or to the contractor who employs the men to build it. All parties connected with the enterprise of raising a new building can side-step the responsibility for these disputes, but it is usually the workman who in the end gets the blame for stoppage of work and organized labor suffers from it.

The contractor, the subcontractor, the architect, the owner, the financial organizations paying the bills, are all innocent losers in a situation not of their making. I know many men who are anxious to build, and afraid to build, because of these jurisdictional disputes. They know full well they have only money enough to complete the building, and can't afford to pay interest charges caused by delay when two or more building trades are at loggerheads over which of them shall perform some item of work. It also affects the bond sales and maybe after a time we shall not be able to finance a building because of these disputes.

The fact is, these jurisdictional disputes have become a matter of grave concern to the whole public. The whole business and industrial machinery of the country is upset as one after the other important factors in the national building program are subjected to loss by these wrangles and stoppages of work. The loss begins with the wages of the trades in dispute. It spreads and spreads until large sections of the public are out of pocket. That sort of thing, if long continued, can slow up the building program of an entire section of the country. When loss comes in a package of that size, it has a bad effect on business generally. It is impossible to overemphasize the bad effects arising from one of these jurisdictional disputes. It is just as hard to overemphasize the importance of getting them settled and stopped as promptly as possible. And the worker himself can't get out of his part in getting them settled.

I don't know of anything that has done more to destroy the chances of organized labor to deal with large organized industrial interests than these civil wars among the unions. Organized labor has withstood destructive assaults, within and without its own ranks. It should root out the jurisdictional dispute. Here and there people are seeking to break the trade union movement in America, but so long as the trade union movement stands true to its principles and deserves the support of its membership and the public, it will get that support. It can not be destroyed. But like other movements in this or any other country, organized labor can commit suicide through internal dissension. And these jurisdictional disputes are just that form of suicide.

It can't be denied that these jurisdictional disputes supply those who are opposed to organized labor with just the propaganda they want for refusing to deal with the union.

Settle these disputes among yourselves, and without stoppage of work. That is profitable to all—to the workers, the builders, the owners.

It is only the building trades that are directly affected by these so-called jurisdictional disputes, but I don't know of anything that has done more to hurt labor in general. In talking with the head of a great manufacturing enterprise as to why his labor wasn't organized, he said to me, "We have more classifications in our industry than there are in the building trades, and if we were dealing with the several unions, their jurisdictional disputes would ruin our business. In the building industry, losses of that kind can be taken care of by directly taxing the people by increasing rents, and so on. But our competition is keen, and we have no way of making up losses that might result from jurisdictional disputes, and we can't take any such chances."

You see the bad effects of these disputes don't end with the building trades but reach out into other industries. In the long run they come right back and injure unionism itself.

I realize that with new inventions, improvements, changes in building materials and methods going on all the time, these craft disputes are bound to occur. Some of these are honest differences of opinion. If the question in these disputes were only wages, working conditions, or other matters between workers and employers, there might be reason for stoppage of work until adjustment is reached. But in the case of which craft shall perform a given piece of work, the owner or employer is not at fault. He has no part in the dispute. He has entered into contract, and tradesmen have accepted certain terms and conditions of employment.

Therefore, in all fairness the owner employer is entitled to labor's service even though the crafts have a difference among themselves. Our agreements call for unbroken work until the job is completed.

If the crafts can't agree, then the matter should go to this Board of Awards in which all are fairly represented. While the difference is being settled, work should go on. And when the Board has decided the question, the decision should be accepted. The resulting chaos if we don't set up and abide by this machinery is plain to all.

We cannot stop progress. Recently I visited several points in Europe and saw many buildings, but I was particularly impressed by one new form of steel construction.

Under this process a steel house is constructed in five weeks by common labor at a cost of about $2500. I cite this simply to illustrate the changes in building that are always going on, and to emphasize the need of this Board to settle these disputes. So long as the building industry continues to progress we need rely on this Board of Jurisdictional Awards, or we all go to destruction.

There are angles to this hold-up habit in building that I can't go into here, but in all the human elements that enter into it, the workman always gets the blame. The jurisdictional dispute is a blot on the fair name of trade unionism. Organized capital doesn't fight itself. It fights its enemies. Trade unionism should stop fighting itself and fight for its best interests. These constant stoppages are costly. They cost the worker, not only in loss of wages, but in constant assessments that the fighting may go on. Every loss caused by these disputes comes home to the worker because every additional cost to a building is paid in higher rents and purchases. These fights are even cutting down work, in frightening people from building.

Here is the case in a nutshell. Invention and change in building methods are going to go on. So long as progress goes on, jurisdictional disputes are bound to occur. The thing is to get them settled. Here in this Board of Awards is the machinery to get them settled. We all have a part in that machinery, and if we don't run it we go to destruction.

After all, the American worker is a business man. We have got to rely on his business sense to refer to this Board all matters of dispute. We must appeal to his business sense to abide by its decisions when handed down. And we appeal to his business sense, his sense of profit and loss to stay on the job and finish the job until his difference is ended.—*Associated Contractor.*

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

"ANTI-HYDRO" Keeps the Concrete Pits Dry in this "Spearmint" Factory

The concrete pits in this new Wrigley plant are permanently waterproofed with "ANTI-HYDRO," and as a result, they are always dry.

A one-inch cement plaster coat mixed with "ANTI-HYDRO" when applied on the inside of pits, walls and foundations keeps them absolutely dry against any head of water.

"ANTI-HYDRO" is extremely easy and economical to use. It is a liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. It accelerates the set of cement and so enriches the concrete that the finishers' time is reduced to a minimum.

For 21 years "ANTI-HYDRO" has proved its economy and satisfaction on every type of hardening and waterproofing work. Use it on your next job.

As The Editor Sees It

A THOROUGHLY amazing incident occurred the other day in a store in our city. A woman of our acquaintance wished to purchase some paper napkins to be used at a George Washington dinner and asked for them at a counter of the store mentioned above. "No," replied the salesgirl, "don't carry them and I don't know anyone but a few Americans who celebrate George Washington's birthday." Needless to say the salesgirl was one of the vast horde of foreigners who seek the comforts, advantages, high wages and better living conditions offered by our great country and, then, view the Fatherland through the glamorous haze cast over it by miles of intervening ocean, and with memory dimmed by long separation from stern reality of hardships left behind them.

A very potent factor in this attitude of mind among our foreign elements is the way in which many nationalities retain their identity in this country, having their own banks, social organizations, and, most important of all, their own newspapers. If such fraternizing creates and fosters such sentiment as we have instanced above, it is up to the "few Americans" to put forth every effort to educate these newcomers to a love of country and a feeling of loyalty toward their adopted home.

We, born and bred in this land of "Hope and Glory," are so used to the wonderful conditions under which we live that we accept our blessings as a matter of course, and soon the foreigner adopts this attitude, forgets the benefits he is receiving as a result of his immigration and is viewing the land of his birth was a tenderness, reverence and loyalty far beyond its due.

It is certainly time that the "few Americans" over here start a "boost America" campaign, and the first step toward that is full realization of just what America means to all of us and the wonderfol conditions which obtain here. Other countries, today, are looking at us as the wonder nation. In Germany, for instance, the greatest interest is shown in what America is doing, many books being published on this subject. One prominent German tells us that in spite of America's high wage scale as compared with Germany's we have nothing to fear in the way of competition, for our marvelous economic efficiency more than makes up for the higher wage scale. So, apparently, we have not much to worry about on the score of foreign competition.

Let us all then, at this anniversary of the birth of our "First American" rejoice in our heritage, and spread the knowledge and realization of our manifold opportunities and advantages, so that the newcomer on our shores may be embued with a spirit of loyalty toward and pride in the most wonderful country of the world, "America!"

CONTRACTORS' RESPONSIBILITY

A Message to the Builders of America

By the National Association of Building Trades Employers

Many of the recognized leaders in the construction industry are greatly concerned about the irresponsible contractor. They look upon him as a menace to the industry and every effort is being put forth to eliminate the irresponsible operator whose only ambition is to get all he can and give as little as possible.

This is a worthy movement and should have the support of every high minded ethical man in the business.

However, at this time it is our desire to treat the question of responsibility from a slightly different angle. We are of the opinion that a contractor who builds according to the best of his ability, following closely the plans and specifications of the architect, who uses the best materials obtainable, who employs none but the highest skilled mechanics in the various trades, who conducts his business on a high ethical plane, but who refuses to participate in and actively support the organization movement of his industry fails in his responsibility.

Perhaps his sin of omission is not as great as the sin of commission of the contractor who deliberately skimps the job, but he is failing in the discharge of a duty and an obligation which he owes to his industry.

Theodore Roosevelt once said, "Every man owes some of his time to the upbuilding of the profession to which he belongs." Every man, be he a cobbler, a lawyer, a baker, a doctor, or a contractor, should take an active interest in the work of the association movement in his particular calling.

Conditions are rarely, if ever, made better in any field of human endeavor without some concerted effort on the part of those who want to see changes brought about. This is especially true in the construction industry. If present practices and abuses are to be corrected these corrections will have to come from within the industry itself.

Considerable progress was made in the organization movement of the construction industry during the first quarter of the present century. There is, generally speaking, a better and more kindly feeling on the part of contractors toward each other. This has been brought about in a large degree through the frequent gatherings of men interested in the same business for the purpose of exchanging ideas and thoughts.

The work has, however, been handicapped owing to the refusal of scores of up-standing contractors in every community to recognize their responsibility to their industry. There are certain individuals in every line of endeavor in every city of the country who have a reputation for fairness and square dealing that makes them marked among men. The influence of these leaders is tremendous; once they are thoroughly sold on the idea of organization, the movement in that particular community begins to grow and prosper.

As we enter 1926, and the second quarter of the present century, it is the wish of the officers of the National Association of Building Trades Employers that this year and the ones to follow may witness a greater realization on the part of contractors everywhere of their duty and responsibility to this vast industry. It is our hope that those who have been pioneers in the movement locally, in the various states and nationally, may take new courage and that those who have as yet failed to discharge their full duty may be brought to a realization of their obligation.—Building Age and National Builder.

FUTURE OF CONSTRUCTION INUSTRY

Present Building Activity in Direct Relation to Declining Cost of Materials

By A. W. Dickson, Executive Secretary
National Association of Building Trades Employers, Cleveland, Ohio

It is generally accepted by those who have made a study of conditions in the construction industry that whether or not the nationwide period of intense activity of the past three years will continue at the same pace in the immediate future will depend mostly on the trend of building wages and the cost of building materials.

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

Have You Seen It?

Have you seen the boiler with the combustion ring? If you haven't seen it work, then you don't know the saving that the ring (illustrated below) makes in the amount of fuel used and the increased length of the firing period.

The combustion ring surrounds the firepot to a height of 4½ inches above the grates, and it has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-3.

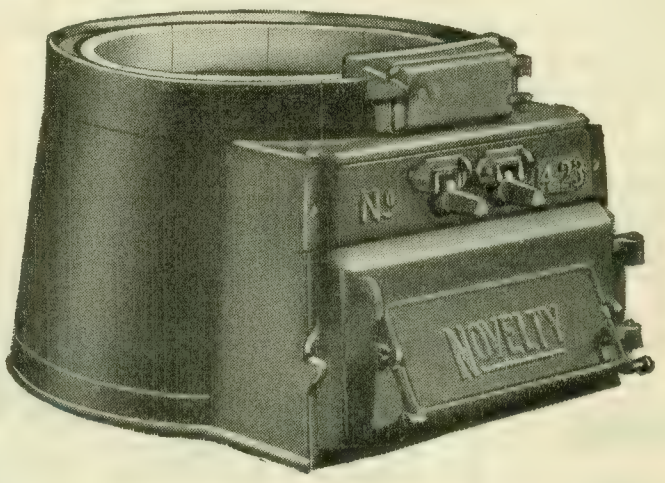

Illustration of Combustion Ring

(Continued from Page 116)

Most authorities are agreed that the immense building shortage which accumulated during the recent world war and the depression immediately following its termination has, in the majority of instances, been made up. Therefore the pressure, which resulted in a determination to build at any cost, has been largely removed. Consequently the prospective builders of the future will be more concerned with costs than they were in the past.

It has been estimated that the normal building need of the country for obsolescence and new demands runs approximately $4,000,000,000 a year. To this figure there must be added the normal requirements of the population growth, which may be stated at about 2,000,000 persons annually.

An important factor which must be considered in analyzing the future trend of the industry is that American people in all walks of life are no longer satisfied with the standards of living which prevailed a decade ago, particularly as far as housing facilities are concerned. People are demanding better homes, office buildings, churches, theaters, etc. Equipment which a few years ago was considered a luxury is now looked upon as being a necessity.

Increased Land Values

Practically every city of any size is witnessing a well defined movement on the part of an ever increasing number of people to get away from the more congested areas to a semi-rural environment. This has been made possible by good roads and the universal use of the automobile as an efficient and rapid means of transportation. Thus is created an unprecedented demand for housing facilities in suburban communities.

Another important factor is obsolescence in buildings. On every hand buildings are being razed which a few years ago might have been considered as satisfactory. Obsolescence is being hastened in many instances on account of increased land values, owners realizing that the financial return from out of date structures is not commensurate with the value of the land on which they stand.

As stated above the pressure has been largely relieved, consequently the prospective builder of this year will have to exercise more care and be assured that the income from a new development will bear a definite ratio to construction costs.

Rents the country over are at fairly stable average level, the general tendency being downward rather than upward. Therefore this leaves as the principal determining factor in considering new projects the elements which enter into building costs represented largely by wages and building material prices.

The present intense activity in the construction industry which got under way in 1923 can be traced as in almost direct relation to the declining trend in the cost of building materials.

A study of the situation made recently by the National Industrial Conference Board shows that taking 1919 as a starting point prices of building materials rose nearly 50 per cent within twelve months, and building wages mounted to the highest point since the war.

Building Material Prices

Early in 1920 building materials began a rapid decline and by the middle of 1921 reached the lowest point of the 1919-1925 period. Building wages also took a slight drop during this time, but failed to reach the low level to which material prices fell. Stimulated by declining wage and material prices, building activity began to increase in 1921, rising in 1922 to a point approximately 30 per cent above the 1919 average. The real boom did not get under way, however, until 1923.

With the increased activity of 1923 building wages began to rise and they have been on the ascendency ever since. They are at the present time about 50 per cent above the 1919 level and ap-

proximately ten per cent higher than the level at the peak of the inflation period in 1920. The level of rates now is 133 per cent above the level of 1913, according to the United States Department of Labor, as compared to 124 per cent above a year ago, or an increase of nine per cent. In 1923 they were 107 per cent above 1913, and the level in 1922 was 97 per cent above, showing the steady advance which has been made in labor costs during the past few years.

Just the reverse condition exists as regards building material prices. At the close of 1925 these were about 14 per cent lower than they were in 1919. Furthermore, material prices have remained fairly well stablized during the three-year period since 1923, and give every indication that there will be but little price variation this year.

Resist Wage Increases

It is generally believed that any further wage increases will be resented by the building public with the inevitable result that the year 1926, instead of being another six billion dollar year in the construction industry will fall far short of that mark. On the other hand there is every reason to believe that if present prices can be maintained there is sufficient business in prospect to put the present year on a par with 1925.

This was the conclusion reached at the recent conference in Chicago held under the auspices of the National Association of Building Trades Employers, which was attended by representative contractors from practically all sections of the country. Without exception these men gave voice to the thought that the building public is of the opinion that the peak has been reached and that any further increases in construction costs will tend to have a depressing effect on the industry in general.

In a number of cities contractors have been confronted with demands which, if granted, will materially raise the cost of construction. A concerted effort is being put forth throughout the country by contractors to resist any and all demands for increases this year.

Five Day Week

Demands for the five day week have been made by some few trades in a number of the larger cities. Such demands are looked upon by employers as being unsound and uneconomic. They see in these requests for a shorter working week an attempt on the part of organized labor to create an artificial labor shortage which will result in increasing construction costs still further.

Since the building industry gives employment directly to a vast number of workers and indirectly to an equal number of others engaged in the production and transportation of building materials it is evident that any tampering with the machinery at this time will cause a reaction in the entire business structure of the country.

Labor leaders who insist on getting increases this year will not be in sympathy with the era of prosperity which the country is enjoying and furthermore will be acting in direct opposition to the best interests of both the organized and unorganized workers in all branches of industry.—The American Contractor.

CODES REQUIRE METAL LATH FOR PROTECTION AGAINST FIRE

Fire Prevention through unprecented activity in matters pertaining to building code revision has been marked within the past two or three years. New light on the subject of code requirements, which will insure safety to life and property, has been thrown on the subject by fire tests made by well-known laboratories, and by the activities of the Hoover Building Code Committee which promulgated the now well-know Hoover Code for small dwelling house construction.

On the one hand there has been a tendency to lessen the strength requirements for materials used in building construction, such for instance, as the brick walls used for dwelling houses, and to decrease floor load requirements. On the other hand, there has been an equally marked tendency towards requiring greater safeguards for the occupants of buildings. These have been put into effect by prohibiting the use of combustible lath and by requiring metal lath for many types of buildings, especially those used for dwellings in this class, next come flat buildings, tenements, apartment houses and small hotels. This requirement at the same time harmonizes with the general thought to reduce cost of buildings, inasmuch as economical one-hour protective construction is much less expensive than the heretofore required so-called full fire-proof construction.

All of these factors have conduced toward a fuller consideration of code requirements, and code changes which in previous years could be skipped over or slighted and pass legislative bodies without comment, have been fully considered, argued and thrashed out, so that they are now fully understood not only by the code committees directly involved, but also by nearly every intelligent citizen in the community.

The one-hour rating accorded by the Underwriters' Laboratories to Metal Lath protected wood studs and wood joisted floors has come to receive the earnest consideration of many building code committees. This has been conclusively shown by a study of codes which have been passed within the last year or two, and for the reader's information we quote herein some of the provisions relative to metal lath which have been adopted in codes throughout the country.

New Bedford, Mass.—This is one of the largest cities in the state and has within the last year adopted a new building code in which Class "E" buildings are defined to consist of stores on the first floor, with apartments and dwellings above. "Buildings of this class, shall have the cellar or basement ceiling metal lathed and plastered . . . or the floor over the basement ceiling may be first-class construction. Note that this places the economy of the one-hour rating construction—lumber and metal lath—at the disposal of the builder, where otherwise it would be necessary for him to use the more expensive reinforced concrete or similar materials for the first floor. There is a further requirement in this code that "in all buildings in classes F and H (apartment houses, hotels, etc.) unless of first-class construction, the entire cellar or basement ceiling shall be metal lath and plaster."

The New Bedford Code, which is taken as typical, further recognizes the value of metal lath protected construction in apartment buildings by the following provisions:

"In all buildings in Class "I" (tenement houses, etc.) in which there is a separate apartment above the second story and also in all buildings in Class "H" (apartment buildings, etc.) that stairs from the cellar or basement to the floor next above shall be enclosed with walls constructed either of 8″ brick, 6″ terra cotta, etc., etc., . . . the soffits of all stairs, the underside of all landings, and the stair side of all partitions except external walls, in all stairways and stair halls, shall be metal lathed and plastered. A wood wainscoting may be used in such stairways and such stair halls, provided it is not over four feet high and metal lathed and plastered down to the floor lines or to the stair stringers."

"All ceilings in hospitals, nurseries and schools in Class 'B' and all ceilings in stores in classes 'E' and 'F' shall be covered with metal lath and plaster.

"All ceilings in building Class 'B' not included in paragraph 'A' and all ceilings in office and store buildings, in Class 'D,' shall be covered with metal lath and plaster.

"ANTI-HYDRO"

Preserves the Concrete Floors in this Preserving Factory

The concrete floors in this building are subjected to the action of fruit juices, acids and chemicals which would ordinarily deteriorate them if the concrete were not protected with "ANTI-HYDRO" throughout the one-inch topping.

In addition to making concrete acid, alkali and oil resisting, "ANTI-HYDRO" also **permanently** hardens and waterproofs concrete—all in one operation

"ANTI-HYDRO" is an indispensable time and money saver in cold weather because it lowers the freezing point of concrete and cement mortars to 15 degrees F. This makes it possible to work during freezing weather and to complete your contracts on time with prompt payments.

Because "ANTI-HYDRO" is a liquid integral compound, it mixes easily with the gauging water—no skilled labor is required.

The 21-year record of "ANTI-HYDRO" results is proof of its **permanence.** Use it on your next job.

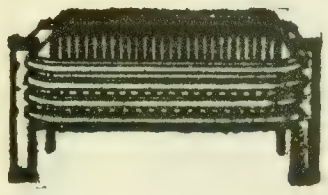
THE METROPOLITAN CASUALTY INSURANCE COMPANY OF NEW YORK

Announce their plan of

Merit Rating for Contract Bonds



The plan of merit rating, now made effective by this Company, has been devised to meet the need long recognized and advocated by responsible contractors for a reform and revision in the method of underwriting contract bonds. Under this plan contractors of demonstrated skill, integrity and responsibility will receive the benefit of a much lower premium rate to which their accomplishments justly entitle them.

Full particulars will be gladly furnished by

RUSSELL MAGUIRE & COMPANY, General Agents

As The Editor Sees It

FIFTY WAYS TO LOWER HOME BUILING COSTS

By Robert T. Jones, A. I. A.

Technical Director The Architects' Small House Service Bureau of the United States

There are only two ways to erect your home at less expense. The first is to get a contractor who will agree to build your home as you want it, without reducing qualities, at a lower price. The second is to reduce your requirements, to take less than you want, both as to quality and quantity. These are the only ways to reduce costs. Your home will cost more or less, depending upon what sort of a bargain you can drive with the man who builds it, and the qualities of materials you use and to what extent your home is completed.

Probably the oldest way to get lower prices for what you want is to bargain for them. In building this is done by taking bids. Contractors compete with each other for the privilege and profit of building your house. If good contractors are selected for this purpose, everyone of whom is competent to build a good house, this method is a wise and fair one to follow. Then the comparison of prices is drawn between like things and it is safe to rely on the low bid. But competition between high grade contractors and cheap contractors often puts the former in a position of disadvantage. They cannot compete with the low prices quoted by the cheap contractors because they will not do the grade of work that satisfies the cheap contractors. Since you also do not want that kind of work, estimates should not be taken from poor contractors. We do not propose that you lower costs of building by substituting inferior qualities of workmanship or materials, for that would not be true economy.

There are many contractors on whose estimates the architect would rely implicitly, without attempting to get competitive bids at all, but there is no doubt that lower prices can often be obtained by bargaining.

All this is on the presumption that you will have one general contractor in charge of the building of your hourse. We believe this is the most satisfactory method for small home builders. You make your contractor responsible for turning over to you a completed building in acceptable condition. He not only provides for completing the actual building, but may be made responsible also for the heating, plumbing, electric wiring, and electric fixtures, though some money can be saved by sub-letting contracts for these last items. If sub-contracts are given to separate contractors, choose them with the same care that you would exercise in selecting the general contractor.

Some builders have tried the expedient of eliminating the general contractor altogether and letting all the various parts of the work to sub-contractors. By this method the owner becomes his own general contractor. He must make the sub-contractors accountable to him. He must synchonize the different parts of the work, get the various sub-contractors on the job at the proper time, adjust differences, buy materials, pay for mistakes he makes, spend an amazing amount of time on the job. This is generally not a good method unless the home builder is unusually familiar with the buying of materials and the direction of labor, and is able to solve the many problems that arise in building. This scheme of building eliminates with the general

contractor all of his skill, judgment, and experience. which are worth a great deal. When the owner assumes these responsibilities he also assumes the liabilities that go with them. Let me repeat that we do not think it wise to dispense with the general contractor unless the owner is widely experienced in building.

Suppose then you have taken bids, compared what the contractors and sub-contractors have to offer, picked the best ones, quality and price considered, and the money they require to build the house the way the specifications and drawings call for it, **giving you just what you want,** is $1,000 too high? What can be done? To the solution of this problem can be applied the second method of reducing cost. You can eliminate certain items. You can cut down the qualities.

Beyond a certain minimum limit almost any sum can be paid for a small house. Take for example one of the Bureau's designs for a small Colonial house. This house has been built many times during the past three years in many different cities. The complete building costs have ranged between $6,500 and $10,000. While these variations in cost have been due to some extent to the differences in cost of materials and labor in different sections of the country and to the varying profits taken by the contractors, an equally important factor in determining the costs were the requirements of the owners.

The $6,500 home is not essentially inferior to the $10,000 home in so far as durability, appearance, and real comfort are concerned. There might have been this difference in cost between similar houses erected side by side by the same contractor. Then the extra cost of the $10,000 house would mean that some home builder had required high priced furnishings and full equipment, and had had to pay for them.

What the Contractor Must Know

The first essential to a program of reducing the contractor's bid is to know what the drawings and specifications call for. Go over the drawings with great care. Be sure you know what is required. Then eliminate what you do not need—partitions in the basement or attic, porches, fireplace, excess millwork. Get down to the basic facts.

Then you must study the specifications. Almost every clause of this document charges you with a liability to pay. For example, floors may be of oak, pine, maple, or other material. And if of oak, then which one of the five different grades? With your architect or contractor to help you, you must decide, and with your decision will go certain increases or reductions in total expense.

You do not require warning not to attempt to save money at the cost of sound methods of construction or to use materials of a quality too low for durability. That would be fatal, and this story does not advocate such a course. But there are things about the house that you can do without for the time being at least. Certainly also for the sake of owning your own home you can get along with some of the more democratic materials and finishes—the middle grades—durable but not luxurious materials.

The following list is composed of suggestions for keeping down costs. Please remember that the values we give are only approximate. You will have to verify them in your local market, as they will vary in different localities. The figures we give are presumed to be average and could ordinarily be anticipated in building a small house of two stories of about 750 square feet ground area.

THE VAN SCIVER CORPORATION · V · SERVICE

WORLD FAMOUS STRUCTURES

The TAJ MAHAL AGRA, INDIA.

THE Taj Mahal, Agra, India, is the most ornate and beautiful piece of monumental architecture in the world and is situated just outside the walls of the city. It was built by the Emperor Shah Jehan as a mausoleum for himself and his favorite wife Muntaz-i-Hahal. It is constructed of white marble and lavishly decorated with mosaic work.

Masonic Home, Willow and Front streets, Trenton, N. J. Architects, Hill & Gollner, Broad Street Bank Building, Trenton, N. J. Owners, Trenton Masonic Association, Mr. S. L. Kauffman, treasurer, Broad Street Bank Building, Trenton, N. J. Indiana limestone, steel, concrete, 3 stories and basement, 98x190 feet, flat roof, hardwood and composition floors, hollow tile, tile, marble and terrazzo work, metal lath, steam heat, electric light. Owners and architects taking bids.

Resdence, Morristown, N. J. Architect, S. Arthur Love, 114 North Twenty-second street, Philadelphia. Owner, Luther Martin, Morristown, N. J. Stone, frame, 2½ stories and basement, irregular in size, hot water heat, electric light, shingle roof, oak and pine floors, ornamental iron work. Architect taking bids due March 6th.

Double Residence, Margate City, N. J. Architect, Charles H. Roberts, Otis Building, Philadelphia. Owners, McIlvaine & Co., Otis Building, Philadelphia. Brick and stucco, cut stone, 2½ stories and basement, 62x16 feet, tile, oak and pine floors, vapor heat, electric light, tile work, bond, dampproofing, ornamental iron work. Architect taking bids due March 12th.

New Jersey Contracts Awarded

School, Colwick, Merchantville, N. J. Architects, Edwards & Green, Camden, N. J. Owners, Board of Education, Merchantville, N. J. Contract awarded Fred Lange, Audubon, N. J., $87,844. Plumbing, Harry Knecht, Camden, N. J., $4,950. Heating and ventilating, Harry Knecht, Camden, N. J., $10,165. Electric, C. S. Wright, Camden, N. J., $1,575.

Factory, Southeast Corner Ninth and Liberty streets, Camden, N. J. Architect, LeRoy B. Rothschild, 215 South Broad street, Philadelphia. Owners, Congress Cigar Co., Third and Spruce streets, Philadelphia. Reinforced concrete, brick, 4 stories and basement, 160x100 feet, slag roof, cement floors, hollow tile, safety treads, steam heat, electric light, hollow metal sash, rolled steel skylights, steel doors, bond, ornamental iron work, metal toilet partitions, tin-covered doors, area gratings. Contract awarded J. S. Rogers Co., Drexel Building, Philadelphia.

Garage (add.), 15 North New Jersey avenue, Atlantic City, N. J. Architect, private plans. Owner, Walter L. Haines, Atlantic City, N. J. Brick, steel, 1 story, 96x63 feet, slag roof, concrete floors, roof ventilators, hollow metal skylights, wood doors (heating, plumbing, electric lighting reserved). Contract awarded Lam Building Co., 1001 Wood street, Philadelphia.

Church, Camden, N. J. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owners, Centenary Tabernacle Methodist Episcopal Church, Camden, N. J. Contract awarded to C. E. Widell, 39 South Sixth street, Camden, N. J.

Building (add.), Northeast Corner Broadway and Jackson streets, Camden, N. J., $3,000. Architect, private plans. Owners, P. D. Hughes Co., Broadway and Jackson streets, Camden, N. J. Brick, 1 story add., 15 feet 6 inches x 29 feet 6 inches, slag roof, pine floors. Contract awarded to T. A. Stoutenberg, 2102 Market street, Philadelphia.

Miscellaneous Construction News

Parish Buildings, Wilmington, Del. Architect, not yet selected. Owners, Diocese of Wilmington, care of Rt. Rev. Bishop Fitzmaurice, Wilmington, Del. Work contemplated. Too early for details.

Manufacturng Building, East One Hundred and Thirty-eighth street, Mott and Walton avenues, New York City. Architects, The Ballinger Co., 100 East Forty-second street, New York City. Owners, Andrea Holding Corp., Adrian avenue and Two Hundred and Twenty-fifth street, New York. Brick, 4 stories. Architects taking bids due March 10th.

Miscellaneous Contracts Awarded

Hotel, Chimney Rock, N. C. Architect, Robert Rodes McGoodwin, 1600 Walnut street, Philadelphia. Owners, Isothernal Hotel Co., Chimney Rock, N. C. Brick, heavy timber, stucco, 3 stories, tile roof, hardwood floors, plumbing ,electric light, tile and marble work. Contract awarded Potter-Shackelford, Greenville, S. C. Plans in proress. Details undecided.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., February 26, 1926. Sealed Proposals will be opened in this office at 3 P. M., March 22, 1926, for remodeling and enlarging, including incidental changes in the mechanical equipment, of the United States Post Office at Lebanon, Pa. Drawings and specifications may be obtained from the Custodian of the building, or at this Office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Archtect.

The Montgomery Iron and Steel Company for years at 9th and Berks Streets, Philadelphia, formerly located at 9th and Montgomery Ave., Philadelphia, are now preparing to move to their new headquarters at Duncan & Sepviva St., Church Lane and Aramingo Ave., Philadelphia. This site was purchased through their representative, Edward H. Cushman, 1416 Bankers Trust Bldg., Philadelphia.

A new shop building 160x256 feet will be located on the new property, as well as an office building, 2 stories, 50x50 feet. Plans are now being prepared for this work, but no set date has been fixed regarding the occupancy of the new location.

The Montgomery Iron and Steel Company has been engaged in fabrication and manufacturing of structural steel and ornamental iron work for over one hundred years. This firm was originally known as Steward and Stevens Iron Works.

Mr. Nelson Mayhew and Mr. Samuel Frank, the present partners in the Montgomery Iron and Steel Company, have been associated with this concern for many years.

(Continued from page 132)

Ways to Save Money

1. It is not necessary to partition fully the basement. If partitions are omitted at the time your home is built you can put them in afterward yourself. Only enough to enclose the fuel bin are really needed. You may save from $50 to $150 in this way.

2. Game rooms are popular. They make an interesting use of basement space. But the cost is high if the room is furnished at all well. $300 to $400 would not go far in a room of this sort. You can save it.

3. The fireplace has been called the heart of the home. Nevertheless a home will run pretty well without it. If you can bring yourself to omit it, the lowered cost of labor and material may amount to $300 or $400—perhaps more.

4. Many wooden houses are improved by the appearance of a brick base course. A stucco house must have some kind of masonry course at grade, and brick is often used for this. If you use brick then select a quality within your means. The higher the base course, the more it will cost. You may save from $50 to $150 through careful study of this item.

5. One of the most effective and easy ways to save money is to omit the porch. In certain climates this would mean a sacrifice of comfort, but often the porch is not absolutely essential. In any event it may be added at a later time. The cost ranges between $200 and $500 or more, depending upon design and size.

6. Glazing a porch is expensive for it requires not only the extra window sash but also the wood trim and its painting, and more expensive flooring than is used on an open porch. The whole additional expense may run as high as $500. You can have the porch glazed later when your funds will permit you to do so.

7. Screening the porch is an extra expense. Full length screens for the windows cost more than half screens. Metal screen frames cost more than those of wood. The wire used in making the screen cloth is of steel, either painted or galvanized, or of copper or bronze. Qualities and durability vary with the cost. Buy the grade of screen you can really afford.

8. The Building Code Committee of the United States Department of Commerce has investigated foundations for small homes and has found it generally true that a well built nine-inch foundation wall of brick or concrete is such an excellent device as to make the building of a thicker wall unnecessary. You can decrease costs by using the thinner wall provided it is soundly constructed. Thicker walls are required by some ordinances. Peculiar soil conditions may make them necessary. But foundation walls are often built unnecessarily thick.

9. The prices of brick, poured concrete, concrete blocks, or wall bearing tile for foundation work vary with the locality. Brick costs less than concrete in some districts; concrete is less expensive in others; and so on. Poured concrete and concrete blocks should be compared from the point of view of price since conditions of the market and at the building site may show that one of these materials has a real price advantage over the other.

10. Most of our modern homes have full basements, yet it is fair to inquire if this is always necessary. A full basement involves deeper foundations and more excavating. A full basement it not an absolute necessity. The saving involved in omitting it may amount to $600 or $700—often more. No matter how much basement you have, you may put in the cement floors later if you cannot afford them now.

11. If the basement excavation is in clay, perhaps you can use the excavation cut for one side of the concrete forms. There would be a saving in doing so. Some building codes do not permit this. If the work is well done, it is nevertheless quite satisfactory.

12. Tile is desirable for bathroom floors, but its greatest usefulness does not extend into wainscotes and coves. Money spent for tile work must be in keeping with your funds.

13. If you stucco the exterior of your home, be prepared to pay from $150 to $250 more than for wood siding. If the stucco has an especially modeled surface, expense is increased.

14. If you build of brick, the initial extra expense may run from $500 to $800 more than for the average wooden finished house. Remember, however, that homes finished with exterior walls of masonry carry a better fire insurance rate and there is a reduction in the cost of future painting. Depreciation is lessened. Even though the initial cost of masonry walls is more, the final cost is less. But you may not have the capital for a building of this class.

15. Wooden shutters bear an important relation to fine appearance in small homes. The improvement they add is out of all proportion to their small cost. Even so, they are not essential to fine appearance and they may be added later when you have more money. If the cost saved per pair applied is $10, it is easy to see how $100 may be saved.

16. Almost all of the devices used to ornament the exterior of your house carry with them an extra cost. When you add wrought iron railings at the door or around the windows, there is an extra cost for the iron work and also for placing it in position. The actual cost must necessarily depend upon how much of this is used. A wrought iron railing around the door may readily cost more than $50.

17. Perhaps your inclinations are toward a bungalow, but your insistence on having all the rooms on floor will almost certainly have the effect of increasing expense. Two-story houses takes less foundation walls, less excavation, less roof.

18. The style of architecture of your house has an immediate bearing on its cost. For with certain styles of architecture it is difficult to achieve desired effects without going to added expense. If, to have a house at all, it is necessary for you to cut down costs, then choose a simple type of architecture. Rectangular houses generally cost less than those built from plans of irregular shape.

19. Wide siding has a better appearance than narrow siding, but the latter costs less. Various kinds of woods used for this purpose cost different sums. Ready stained shingles used for the side walls of frame houses usually cost less than wide siding. Adjust this item to your pocketbook.

20. The initial cost of wood shingles for roofing is less than tile or slate, although wood shingles are not as durable and they are less fire resisting. Fire laws in some localities require that you use certain special types of roofing materials. There are variations in prices and qualities for each kind. High quality counts heavily, but do not attempt to buy varigated tile with a wood shingle pocketbook. If you have wood shingles brush coated, be prepared to pay from $25 to $50 more. If the shingles are dipped the expense will be increased still more, but their durability will be increased. It is better to omit such items as the porch, which can be added at any time, and to spend the money saved on better materials that count for permanent construction, including the roofing.

21. Fire stopping in frame walls is recommended by the National Board of Fire Underwriters. It is designed to reduce losses by fire. Installation of fire stopping material involves an expense of from $75 to $150. Whether or not you may omit it depends upon the location of your building with respect to the fire limits and the extent of your home building budget.

22. We are especially interested in good construction and earnestly recommend that you insist upon it if you hope to make your dollars buy full value. In this connection we think that all exterior wooden walls should be insulated, wherever the house may be located, for insulation performs a real service in fuel savings and in comfort. It is effective in both hot and cold weather. You, therefore, cannot afford to omit insulation in regions of severe winters, but elsewhere it is relatively not so important. An expense of from $75 to $350 is involved. Buy the type you can afford.

23. Built-in fittings in the kitchen cost from $100 to $300, depending upon their design, the finish, kind of wood used, and how extensively the kitchen is fitted with them. It might be less expensive for you to do without built-in fittings, at least temporarily, substituting therefore the ready-made devices of the kind. Unless the built-in fittings are extremely well designed, the ready-made kitchen cabinets are preferable and they may cost you less.

24. Extra built-in millwork such as book cases, wardrobes, china closets, cost heavily. They become real luxuries when means are limited. The actual amount involved depends on how many of these conveniences are used. And you can always buy them when you can afford them.

"ANTI-HYDRO"

Preserves the Concrete Floors in this Preserving Factory

The concrete floors in this building are subjected to the action of fruit juices, acids and chemicals which would ordinarily deteriorate them if the concrete were not protected with "ANTI-HYDRO" throughout the one-inch topping.

In addition to making concrete acid, alkali and oil resisting, "ANTI-HYDRO" also **permanently** hardens and waterproofs concrete—all in one operation

"ANTI-HYDRO" is an indispensable time and money saver in cold weather because it lowers the freezing point of concrete and cement mortars to 15 degrees F. This makes it possible to work during freezing weather and to complete your contracts on time with prompt payments.

Because "ANTI-HYDRO" is a liquid integral compound, it mixes easily with the gauging water—no skilled labor is required.

The 21-year record of "ANTI-HYDRO" results is proof of its **permanence.** Use it on your next job.

As The Editor Sees It

THE WELL-BUILT CHIMNEY AND FIREPLACE

It has been said that any second rate artist could paint the family seated around the fireplace but the best artist who ever lived could not paint the family at home around a radiator. There is an element of truth in this statement. Most peope feel that a home is not complete without at least one fireplace, although it is no longer a necessity in the family life.

The fire place should be one of the structural elements in home building be cause of its usefulness and prominence in a room. The chairs are generally gathered around a fireplace. This and the fact that the brightly glowing fire is always an attraction, means that the fireplace is the center of interest. A visitor coming into your home for the first time will glance first at the fireplace and then at the books on your shelves nine times out of ten. Realizing this, one must needs pay special attention to the planning and decoration of the fireplace.

During the years between 1840 and 1900, when America was at its lowest ebb architecturally and decoratively many fireplaces that were unspeakably bad were built into homes. These were bad structurally and decoratively. So many years had passed since fireplaces were used as the only means of heat that the builders had lost the knack of constructing them so as to let the heat come out into the room and the smoke be drawn up the chimney. Masons looked upon them with tolerance and felt when they were putting them in, that they were gratifying a more or less foolish whim of the home builder and that it really didn't matter whether the fireplace would function adequately or not. Consequently nine fire places out of every ten either smoked so that they blackened the rooms noticeably or didn't draw at all and were quite useless. The woodwork was a mass of ginger-bread showing all the fantastic possibilities of the scroll saw and chisel. Often such fireplaces have to be completely done away with, if the living room is to be made beautiful according to the more simple rules of decoration in vogue today.

Quite often the fireplace which is located caty-corner is artistically bad. It is seldom a success unless planned by a good architect. The fireplace that is a huge mass projecting out into the room is also in poor taste. A fireplace that is unusually high gives the room the appearance of added height, while a broad, low fireplace is inclined to give a cottage like feeling to the room. Above all, the fireplace mustn't look cramped or crowded. It is in perfect taste when it has the appearance of being there simply to contain a comfort-giving fire.

Now that we are all striving to do away with anything that savors even faintly of being pretentious in the home, we will guard against a fireplace too rich in ornamentation. A fireplace appropriate in size, color and shape for the particular room which it is to be built in is a general rule to keep in mind when planning your home.

Avoid loading the fireplace with wood trim particularly near the opening as this is a dangerous thing to do and is poor architecturally on that account. The wooden shelf with build-in mirror above so popular in the Victorian period is obsolete. It is a mistake to use too much glazed tile around the fireplace because this smooth, glossy surface acts as a reflector producing high lights which are cold and inartistic. The color scheme should be rich, but not obstrusive. There is an infinite variety to the schemes that can be worked out using

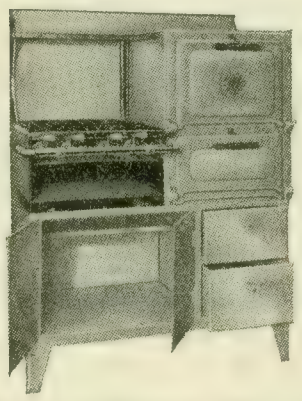
face brick. A point to be avoided here is using brick with too strong contrast in color which gives a spotty appearance. A fireplace can not be changed as easily as walls can be redecorated or rugs and furniture replaced, so that one can save time, money and disappointment by studying the various styles of fireplaces even before talking with their architect concerning one. The new American wing at the Metropolitan Museum of Art in New York City contains a noteable collection of fine American fireplaces. There are numerous others that could well serve as an inspiration and pattern for the building of a fireplace in a new home.

If you plan on using oriental rugs, mahogany furniture and silk draperies, you will do well to use tile instead of a rough brick in the fireplace. On the other hand, if your furniture is of oak or walnut rubbed dull, your rugs are conservative and your draperies of linen, theatrical gauze, cretonne, or chintz, you will want to use brick or a dull mat tile of a course textured material.

The proper construction of a fireplace is something that was once learned, forgotten when the fireplace fell into disuse, except as a fad, and had to be learned over again. The rough or unexposed portion of the fireplace is usually constructed of common brick laid in cement or cement-lime mortar. Stone, cement and hollow tile can aso be used. The fire chamber should be lined with fire brick laid in fire clay and the portion of hearth under the fire should be of this same material. The sides of the fire chamber should be beveled so that the heat will be thrown into the room and the back should curve in at the top for the same reason. Fireplace openings in the small or medium sized home may run from two to three feet wide and should not be over two feet six inches high, in fact for a two foot width this is too high; the height should not be greater than the width. Dependent upon the area of the fireplace opening in the area of the chimney flue. Experts vary in their recommendations considerably, some claiming a flue must be one-eighth of the opening area and others claiming one-twelfth is sufficient. It is safe to use an eight by twelve flue for opening up to thirty inches in width and a twelve by twelve flue for larger ones. The depth of the fire chamber is usually about twenty inches which seems to be regarded as a standard. We know of a fireplace in an architect's home which is only fourteen inches deep and works perfectly, the opening is thirty by thirty and the flue is directly above the fire chamber. The advantage of a shallow fireplace is that much less heat goes up the chimney. The mason of today has no excuse for not building a satisfactory fireplace when he has the advantage of using an iron throat or mantel dome containing the damper such as are on the market at very moderate prices. When this equipment is installed according to the manufacturer's directions the fireplace will draw perfectly and the fire is easily controlled by the damper. An ash drop should always be provided and the kind consisting of two leaves which drop down is very good. An eight by twelve cleanout door should open into the basement from the bottom of the chimney.



There are many materials for facing the mantel. Tile is widely used at the present time probably because the new architecture demands its use. Tile has been greatly improved both as to appearance and durability of late. Faience tile is used for the facing in many installations and can be recommended. This tile comes in glaze, dull glaze and matt glaze; the latter has a course textured surface and is more suitable for informal mantel designs than the first two. Faience tile receives a very high degree of firing and will not present a surface full of hair line cracks after use such as the old fashioned glazed tile does.

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

Have You Seen It?

Have you seen the boiler with the combustion ring? If you haven't seen it work, then you don't know the saving that the ring (illustrated below) makes in the amount of fuel used and the increased length of the firing period.

The combustion ring surrounds the firepot to a height of 4½ inches above the grates, and it has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-3.

Brick, steel, 4 stories, 74x109 feet, slag roof, hardwood floors, vapor heat, electric light, metal lath, tile and marble, iron stairs, ornamental iron. Architect ready for sub and general bids.

Toch Bros., Inc., manufacturers of R. I. W. Waterproofing and Dampproofing, have opened an office in the Bourse Building, Philadelphia.

The R. I. W. Dampproof Resisting Paint Company have opened an office at the same address.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the would hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

(Continued from page 148)

Quarry tile is cheaper than faience tile and may be obtained red brown and gray shades. This tile has a dull surface and is widely used for floors. It can be used for both hearth and facing and it can be made to stand out strikingly by using mortar of a darker color. In addition to faience and quarry tile are ceramic, mosaic, vitreous, semi-vitreous, paving, flint, plastic and numerous others, each very good for certain purposes. It is best to consult your local dealer before buying, as some tiles are more easily obtained in some districts than others.

Kasota stone, a brownish rough surfaced material, is proving popular in the Northwest for fireplaces of informal type. Sometimes a border of this stone in uneven shapes is placed around the edge of the opening and the plaster is carried down to this stone. With this treatment the mantel shelf may be omitted and often a tapestry is hung on the chimney breast for decoration.

Face brick is excellent for the mantel in many instances. Much depends on the color of the mortar joints for the effect produced. Brick is more easily laid up than other materials and this makes its use highly desirable where expert labor is not available. There is no end to the patterns that can be devised for both the hearth and facing.

The colonial mantel almost always has a wooden frame around the opening separated from the edge by a border of tile marble or brick. Sometimes pilasters are used at the sides. On a colonial mantel both the shelf and molding should be light. The mantel shelf can be omitted to fit in with certain architectural treatment as mentioned above. In the western style home with broad heavy lines the shelf may be a three inch plank with brackets or with brick corbels in place of brackets.

The hearth is an important consideration both from the standpoint of fire protection and appearance. A hearth should not be less than eighteen inches wide measured out from facing of mantel and should extend at least a like distance past the edge of the opening. Narrow hearths may seem novel but are not advisable as there is not enough room to set a fire screen on and a spark may easily reach t he wood flooring. The hearth may be raised above the floor level and looks well when thus treated. This is not a good thing to do in a small room, however, as it reduces the floor space.

There are unlimited possibilities in fireplace design and it is regrettable not to get an attractive one with the excellent materials available.

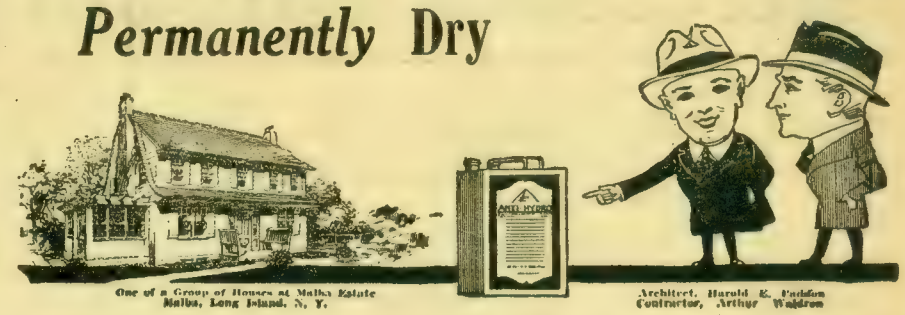
Fire Prevention

By trying to prevent fire you not only help to reduce your premium but assist in saving part of the country's $500,000,000 fire loss.



Ask your agent about it.

Insurance Company of North America

PHILADELPHIA

"The Oldest American Fire and Marine Insurance Company"

"ANTI-HYDRO" Keeps These Cellars *Permanently* Dry

One of a Group of Houses at Malba Estate
Malba, Long Island, N. Y.

Architect, Harold E. Paddon
Contractor, Arthur Waldron

The houses at Malba Estate are built on "springy" ground, but the cellars of all of them are always dry, because the concrete foundations, walls and floors are permanently waterproofed with "ANTI-HYDRO."

No matter how large or small your job may be, you will find "ANTI-HYDRO" the most satisfactory as well as the most economical concrete waterproofer and hardener you can use. It both hardens and waterproofs in *one operation.*

"ANTI-HYDRO" is a liquid integral compound which mixes easily with the gauging water—any unskilled laborer can do it. Twenty-two years of successful use is your guarantee of satisfaction when you use "ANTI-HYDRO." Try it on your next job for permanence.

As The Editor Sees It

FIFTY WAYS TO LOWER HOME BUILDING COSTS

By Robert T. Jones, A. I. A.
Technical Director The Architects' Small House Service Bureau of the United States.
(Continued from previous issue)

Recently I told you of twenty-five ways by which you could decrease the first cost of building your home. You probably deduced from the story that after all there are only two ways to achieve the necessary reductions.

The first of these is to strike a good bargain with a high grade contractor—to find a man who will build your house so that it will be an honor to him and a safe investment for you at a price below what others would charge. Whether this lower price comes from a decreased profit to the contractor, or from savings he is able to make through better management in the buying of materials and in the direction of workmen, is immaterial to you so long as the contractor is really high class, gives you a good house and does build at a lower price.

The second way to reduce costs, for the time being at least, is to do without those things that are not absolutely essential. I advised you also to choose the middle grade of materials, the more democratic devices, with the proviso that nothing cheap, shoddy, or weak be used.

You Must Decide

This time I am giving you twenty-five more ways to lower home building costs. It may not be necessary for you to apply every one of them to your particular problem. We hope not. They are merely suggestions. Here they are:

26. A built-in refrigerator with outside icing door and raised platform is more expensive than a separate refrigerator not so advantageously equipped. A refrigerator waste is also an an extra expense. The type of refrigerator must be selected with an eye to the limits of your purse. You may save from $25 to $50 on this item.

27. To the mechanically inclined American the idea of an electric refrigerator installed in the home is particularly intriguing. However, it is not essential that this equipment, no matter how desirable, be installed at first. It may be classed properly as one of the worth while devices you will provide for your home when you have the money for it.

Your Purse the Brake

28. Perhaps you do not need to finish all the rooms just now. Omitting the plaster, finish flooring, and wood trim in rooms not needed at first will save something. It would be cheaper in the long run to have all the work done at once, but your ready funds may not permit it.

29. When moldings, kitchen cabinets, doors, and sash are supplied from "stock," they cost less than devices of this kind made to special designs. If you are trying to keep down costs see what your contractor can get ready made from his local lumber dealer's stock. "Special" millwork always costs much more.

30. Hardwood floors cost more than those of soft wood. In every kind of wood there are various grades with varying degrees of expense. For example, as between the first and second grades of plain oak flooring, there may be a difference of $50 or more in the cost of build ing your home. The medium grades are durable, and if the millwork is well done, and you have good workmanship with good painting, staining, and filing, appearances will be fine.

31. The cost of wood trim varies as does the cost of flooring. Soft wood is less expensive than hardwood for interior finishing. Soft woods such as fir and pine can be used to advantage and at a

WITHERSPOON BUILDING PHILADELPHIA
Ornamental Iron

saving, especially if they are painted. Some of the inexpensive woods, such as cypress or poplar, stained or oiled, are beautiful. As between hardwood and soft wood trim for your home, there may be a difference of $50 to $100.

32. Before you have the woodwork finished, find out about the relative expense of stain and varnish, painting, and enamel work. The finish of stain and varnish costs less than paint. Paint costs less than enamel. There may be a difference of $100 or more in the last two methods. If you enamel only part of the house and paint or stain the remainder, your expense will be decreased proportionally.

33. A bare plastered wall finished smooth is not a pleasing sight, especially to the housewife who loves color and pattern. And yet here is a part of your home making that can be postponed. In the meantime if walls settle a little and the plaster cracks, repairs can be made before decorations are finally applied. The actual reduction in the total cost of building is worth while, especially if you do not have the ready money.

34. The quality of glass used in your house will affect building costs directly. Plate glass costs more than ordinary window glass. Mirrored doors are an extravagance for anyone who must exercise strict economy. French doors, however beautiful, cost money. Perhaps you can omit them for the time being, especially from such openings as the one between the hall and living room.

Extras Add to Costs

35. A clothes chute is certainly a convenience, but it could hardly be called an absoute necessity. Propery built of metal and with self-closing doors, it must cost $25.00 or more.

36. Like practically all the other materials that go into a house, plumbing fixtures are manufactured in several materials—vitreous china, solid porcelain, or iron coated with enamel. Each of these has its special qualities, but the chinaware is more expensive than enamled iron. The extra expense for chinaware is balanced by its advantages in the way of appearance and ease of cleansing but the enameled iron is also durable and costs less.

37. The simple leg tub has practically gone out of style, having been displaced by the recess type, but the latter not only costs more in itself but requires an extra expense in framing and plumbing. A recess tub may cost as much as $50 more than a leg tub. In the different materials and designs in which this fixture is offered there is a wide range of expense.

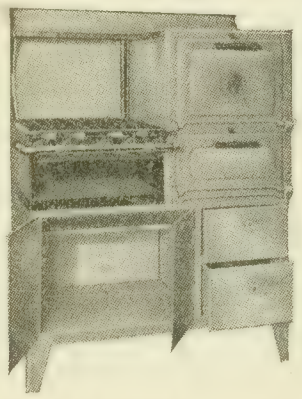
38. Lavatories cost more or less depending upon the size and style and the material of which they are manufactured. Between a solid porcelain lavatory and one in enameled iron there may be a difference of $50. The substitution of an ordinary chain and plug waste device in place of the "pop-up' waste may save $5.00.

Compare Like Things

39. There are a great many types of water closets. They are obliged to be made of vitreous chinaware. The simple ones are satisfactory if well made. You can save $25 to $50 by selecting a simple and economical fixture of this kind.

40. The kitchen sink is usually made of enameled iron. Sinks with aprons or with drain boards cast on are more expensive than those without either or both of these. A wooden drainboard is less expensive than one of enameled iron. Combination hot and cold water faucets will cost from $5 to $10 more than separate faucets.

41. In the laundry you may spend various sums for tubs depending on what they are made of and their size and number.



42. Hot water heaters present a fine opportunity for you to spend your money or economize it, depending upon how easily you are satisfied. Those types of hot water heaters which operate so that there is always a supply of hot water ar-

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., March 10, 1926. Sealed Proposals will be opened in this office at 3 P. M., April 1, 1925, for remodeling and for covering driveway, including incidental changes in the mechanical equipment of the United States Post Office, McKeesport, Pa. Drawings and specifications may be obtained from the Custodian at the building or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., March 8, 1926. Sealed Proposals will be opened in this office at 3 P. M., March 31, 1926, for remodeling and enlarging, including incidental changes in the mechanical equipment, of the United States Post Office at Lynn, Mass. Drawings and specifications may be obtained from the Custodian at the building or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 164)

certainly most convenient, but they cost more to operate and the first cost of the equipment is greater than for the type which may be turned on from time to time as required. Costs vary with the convenience afforded. Your plumber will demonstrate this for you.

43. There are several types of heating plants. All are satisfactory if they are well designed and properly installed. Each one has special qualities which distinguish it from the others, and there are differences in cost as well. Personal preferences are usually quite fixed in regard to the kind of heating system that must be used, but you may not be able to buy the particular kind of heating system you prefer. In order to have your house, you must be prepared to take here as elsewhere throughout the building, what you can afford. We urge you not to buy a cheap heating device whatever system you select.

44. A heat regulator should go into every home as a definite means of maintaining even temperature and of decreasing costs of fuel, but one of these regulators costs from $50 to $150, and so may be outside of your immediately available funds. You may have your house wired for this and install it later on.

45. Since low radiators can be placed under windows they are in the best position to overcome heat losses that take place through the windows. In this position they also leave wall space for furniture. These are advantages the high type radiators do not have, but the high type costs less. You are the one who must decide and who must pay the bills.

Cut Quantity and Add Quality

46. The equipment of the radiators is another item of variable expense. For example, the valves may be of the ordinary kind, or they may be "leakproof," which cost more, or you may have the "indicator"type. Compare costs on this equipment. Take what you can afford.

47. Heating pipes should be insulated. The better they are insulated the more satisfactory the heating plant will work—the lower its cost of operation—but the quality and expense of this insulation has a direct influence on the initial cost of your home. Get a good job here even if you have to wait for it.

48. Hardware represents an opportunity for you to exercise economy. There is a wide difference between the appearance of an ordinary pressed steel doorknob and one made of cast bronze in the form of a lever handle. You must decide whether you will spend $100 for hardware, or $200.

49. Electric fixtures, like hardware, do not ordinarily represent a very large percentage of the total building cost. Yet there is a difference in quality and in design and finish, with which go differences in cost. Cast brass fixtures must necessarily cost more than those spun from thin sheets of this metal. There will be a saving here if you are careful. Tastefully designed fixtures may be obtained without excessive cost.

50. The cost of wiring your home will be affected directly by the number of outlets for lighting fixtures and switches that are supplied. The convenience afforded by numerous outlets should be recognized and yet it is wholly possible to install more than is really necessary. The cost is fixed by the rate per outlet. It will be seen that the omission of even two or three at $4.00 per outlet would mean something.

The above are some practical ways to assist you in reducing the cost of your home. If you will go over each one, *preferably with a competent local architect to help you,* to see how you can make it apply in your building, and then if you will learn from your contractor the amount of money saved by each one, you will see just what the total sum saved amounts to. Your savings may easily amount to as much as $1,000. Be sure to cut out the non-essentials first, things that can be replaced later on. But never reduce qualities or workmanship to a point where durability is threatened.

Fire Prevention

By trying to prevent fire you not only help to reduce your premium but assist in saving part of the country's $500,000,000 fire loss.

Ask your agent about it.

Insurance Company of North America

PHILADELPHIA

"The Oldest American Fire and Marine Insurance Company"

"ANTI-HYDRO" Keeps These Cellars *Permanently* Dry

One of a Group of Houses at Malba Estate
Malba, Long Island, N. Y.

Architect, Harold E. Puddon
Contractor, Arthur Waldron

The houses at Malba Estate are built on "springy" ground, but the cellars of all of them are always dry, because the concrete foundations, walls and floors are permanently waterproofed with "ANTI-HYDRO."

No matter how large or small your job may be, you will find "ANTI-HYDRO" the most satisfactory as well as the most economical concrete waterproofer and hardener you can use. It both hardens and waterproofs in *one operation.*

"ANTI-HYDRO" is a liquid integral compound which mixes easily with the gauging water—any unskilled laborer can do it. Twenty-two years of successful use is your guarantee of satisfaction when you use "ANTI-HYDRO." Try it on your next job for permanence.

Insurance Economy

Insufficient insurance isn't economy. It takes but one loss to prove that.

The first step toward economy in insurance is to choose adequate protection, written by a company of known reliability.

The Philadelphia Fire and Marine Insurance Company is a financially strong, powerful organization with an enviable record for reliable service.

Which Bid Is Right?

Low Bid	-	$34,665.00
Second Bid	-	40,995.00
Others up to		46,398.00

These are actual bids recently submitted for the same job. They are not exceptional. They show why many good builders go broke. Correct estimating methods would eliminate such guessing and take much of the risk out of contracting. Particulars sent free to *bona fide* contractors.

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

Have You Seen It?

Have you seen the boiler with the combustion ring? If you haven't seen it work, then you don't know the saving that the ring (illustrated below) makes in the amount of fuel used and the increased length of the firing period.

The combustion ring surrounds the firepot to a height of 4½ inches above the grates, and it has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-3.

Bridge No. 27, Rausch's, East Brunswick Township, Schuylkill County, Pa., reinforced concrete, 75 feet long. Certified check 5 per cent. of the bids.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

Robert McGonagle, Plasterer, of 3408 North Twenty-fourth Street, Philadelphia, has moved his office to 2313 Walnut Street, Philadelphia.

PAINTED WALLS

Painted walls, while as old as paint itself, have depended for their popularity, during the last decade or so, upon their efficiency as sanitary agents, and their durability as finishes. A painted wall was a plain wall; on account of the limitations of popular conception, its color range was limited, too.

Apparently some one, a few years ago, realized that in using paint on walls he was employing the ancient decorative medium with which the beautiful walls since time immemorial have been decorated. It is the same medium, with a color range almost limitless, when you consider the shades, tones and combinations that are possible, and all the practical utilitarian qualities that modern life demands.

Any number of colors may be used. For instance, the ground color may be light tan. The first sponge markings may be of delft blue, another of lavender gray and still another of pale yellow. This finish is extremely easy to execute and is very successful. No matter how many colors are used, the walls may be washed. Another advantage is that a truly flexible color scheme can be evolved, based upon the colors that are used in rugs, furniture or drapes. If a change in color schemes is desired, a new color may be added to the finish.—Keith's Magazine.

FIRE RESISTANCE OF HOLLOW BUILDING TILE

Progress Report on Work at Bureau of Standards Has Just Been Released

For several years the Bureau of Standards, Department of Commerce, has been conducting tests on hollow tile in co-operation with the Hollow Building Tile Association. These tests are planned to yield more reliable information than is now available on the properties of hollow tile, such as the strength of walls and their ability to withstand the effects of severe fires. The annual progress report which has just been issued, is concerned principally with the fire tests.

For these tests walls 16 feet long and 11 feet high were built, and placed so as to form one wall of a furnace. The fire in the furnace during a test is regulated so that a temperature of 1700°F is reached after one hour, and 2150°F at the end of six hours, if the wall does not fail previously.

The tests show the effectiveness of the walls in preventing spread of fire. Some of the lighter 8-inch walls after several hours exposure become hot enough on the unexposed side to set cotton or excelsior on fire, and this was taken as a sign of failure. None of the walls failed by actual collapse.. The tests showed the great value of a protective coat of cement of gypsum plaster when walls are subjected to fire. The heavier 8-inch walls and the 12 and 16-inch walls showed very good fire resistance.

These tests are considered of great value to the industry and to the public in that they provide reliable data on the extent to which hollow tile walls can be relied upon for protection in case of fire.

Ideals are like stars; you will not succeed in touching them with your hands, but like the seafaring man on the desert of waters, you choose them as your guides and, following them, you reach your destiny.—Carl Schurz.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

Men are walking by and around people that want to buy from them, and do not know it.

The DAILY BUILDING NEWS will tell you who wants to buy your products.

The right way to Prevent Fire Loss

The only safeguard against fire loss is to have adequate insurance protection of the right kind—insurance written in a strong, reliable company having a nation-wide organization and a reputation for promptness and service.

"The Oldest American Fire and Marine Insurance Company"

Founded 1792

Insurance Company of North America

and the

Indemnity Insurance Company of North America

write practically every form of insurance except life

"ANTI-HYDRO" Made the Leaky Walls and Pits in this Post office Waterproof

The concrete pits and the walls of the pipe tunnels in this post office leaked badly. A cement *plaster coat* mixed with "ANTI-HYDRO" was applied to the *inside* of the walls and pits. Now they are absolutely and permanently waterproof.

There is not a single concrete waterproofing or hardening problem that cannot be successfully overcome by the use of "ANTI-HYDRO." It is an easy-to-use liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. Results are guaranteed permanent.

Use "ANTI-HYDRO" on your next job. For over 22 years it has been specified by leading architects, engineers and contractors.

Lodge Building, Williamsport, Pa. Architect, F. Arthur Rianhard, Masonic Temple, Williamsport, Pa. Owners, B. P. O. E., No. 173, Williamsport, Pa. Brick, steel, concrete, stone, 4 stories, 60x90 feet, rear 1 story, 90x110 feet, built-up roof, hollow tile or cinder block, safety treads, waterproofing and dampproofing, ornamental iron, iron stairs, fire doors. Contract awarded to Jacob Gehron Co., Williamsport, Pa.

Apartment House, Strafford and Lansdowne avenues, Lansdowne, Pa. Architect, Sol. Kaplan, 10 South Eighteenth street, Philadelphia. Owner, George Weiss, care of builder. Brick, 3 stories, 110x160 feet, slag roof, hardwood and rubber tile floors, vapor heat, oil burning equipment, electric light, tile and marble work, plumbing. Contract awarded J. F. Roystone, 705 East Girard avenue, Philadelphia, who is taking sub-bids. Work started.

Residence, York, Pa. Architect, E. D. Leber, Hay Building, York, Pa. Owner, A. F. Fox, 807 South George street, York, Pa. Stone, 2½ stories, 47x32 feet, slate roof, hardwood floors, tile work, electric light. Contract awarded to I. Riandollar & Son, York, Pa.

Moving Picture Theatre, Red Lion, Pa. Architects, Gemmill & Billmeyer, Rosenmiller Building, York, Pa. Owner, W. J. Rothensies, Red Lion, Pa. Brick, steel, concrete, 1 story, 60x154 feet, slag roof, concrete and composition floors, hollow tile, roof ventilators, waterproofing and dampproofing, architectural terra cotta, ornamental iron work, fire doors, steel sash, metal lath, vapor heat, electric light. Contract awarded to W. Thompson, Red Lion, Pa.

Pickering Creek Filter and Pumping Station, near Phoenixville, Pa., $75,000. Architect, private plans. Owners, Philadelphia Suburban Water Co., Mr. C. E. Davis, general manager, 1612 Market street, Philadelphia. Brick, steel, concrete, cut stone, 1 story, 69x67 feet, gypsum slag roof, cement floors, bond. Contract awarded U. G. I. Contg. Co., Broad and Arch streets, Philadelphia.

Nurses' Home, Pottstown, Pa. Architect, F. A. Muhlenberg, Ganster Building, Reading, Pa. Owners, Pottstown Hospital, Pottstown, Pa. Brick, steel, 2 stories and basement, 100x30 feet, composition built-up roof, maple floors, limestone, steam heat, electric light, tile work, plumbing. Contract awarded to F. H. Keiser, Pottstown, Pa. Plumbing and heating, Charles Hinchman, Pottstown, Pa. Electric, R. Miller, Pottstown, Pa.

Bungalow, Richboro, Pa. Architect, Harry Parker, 1120 Locust street, Philadelphia. Owners, Cameron & Elizabeth Spencer, Richboro, Pa. Stone, 1 story, 42x35 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Contract awarded John K. La Rue, Wrightstown, Pa.

Residence and Garage, Wyndmoor, Pa. Architect, J. W. Keyes, 1520 Locust street, Philadelphia. Owner, H. B. Price, Wyndmoor, Pa. Stone, 2½ stories and basement, 25x50 feet, garage, 20x20 feet, slate roof, oak and pine floors, hot water heat, electric light, tile work. Contract awarded Samuel Harting & Son, 20 East Johnson street, Philadelphia.

Dam, Phoenixville, Pa. Architect, private plans. Owners, Philadelphia Suburban Water Co., C. E. Davis, general manager, 1612 Market street, Philadelphia. Concrete. Contract awarded Ambursen Const. Co., Grand Central Terminal Building, New York.

New Jersey Construction News

Schools (2), Westville Grove and Jericho, N. J. Architects, Hill & Gollner, Broad Street Bank Building, Trenton, N. J. Owners, Depford School Board, Westville, N. J. Low bidders: Westville Grove—Brick, 1 story and basement, 4 rooms, slate roof, pine floors (heating, plumbing and electric separate); Barnes Const. Co., 1828 Arch street, Philadelphia, $36,500; plumbing, Harry Knecht, Collingswood, N. J., $1,530; heating, Mechanical Equipment Co., 214 South Twelfth street, Philadelphia, $3,594; electric, Franks & Sweeney, Camden, N. J., $745. Low bidders: Jericho—Brick, steel, 1 story and basement, 2 rooms, slag roof, pine floors (heating, plumbing and electric separate); Barnes Const. Co., 1828 Arch street, Philadelphia, $15,900; heating, Mechanical Equipment Co., 214 South Twelfth street, Philadelphia, $3,249; electric, R. C. McMann, care of owner, $397.

Warehouse, 1300 Pine street, Camden, N. J. Architect, not selected. Owners, South Jersey Warehouse Co., William Romal, Jr., Thirteenth and Pine streets, Camden, N. J. Reinforced concrete, brick, 4 stories and basement, 150x100 feet, slag roof, cement floors, ornamental iron work, steel sash. Work contemplated.

Church and School, Merchantville, N. J., $100,000. Architect, not yet selected. Owners, St. Peter's Roman Catholic Church, Rev. J. B. Conway, Merchantville, N. J. Work contemplated.

School, Salem, N. J., $100,000. Owners, St. Mary's Roman Catholic Church, Rev. T. F. Hennessey, Salem, N. J. Work contemplated.

Hotel (alts. and add.), Ocean City, N. J. Architect, R. R. Neely, 2301 Spruce street, Philadelphia. Owner, name withheld. Raising entire building and putting in an additional new first floor, brick, 40x80 feet, slag roof, plumbing, heating, lighting, painting, glazing, plastering, general alterations. Plans in progress.

Store and Apartment, 633 South Warren street, Trenton, N. J. Architect, L. S. Kaplan, Fitzcharles Building, Trenton, N. J. Owner, Hyman Levie, 633 South Warren street, Trenton, N. J. Brick, steel, 2 stories, 22x80 feet, slate roof, pine floors, hot water heat, electric light, tile work, plate glass, copper work. Plans in progress.

Service Station and Garage, Hamilton Township, N. J. Architect, L. S. Kaplan, Fitzcharles Building, Trenton, N. J. Owner, S. Feinstein, care of architect. Brick, steel, 1 story, 54x150 feet, slag and tile roof, concrete floors, hollow tile, steam heat, electric light, metal lath, steel sash, fire doors. Plans in progress.

Public Comfort Station, Farm No. 2, Cinnaminson, N. J. Architect, Watson K. Phillips, 213 South Fifth street, Philadelphia. Owners, Campbell Soup Co., Camden, N. J. Brick, 1 story, 30x30 feet, asphalt shingle roof, cement floors, plumbing, septic tanks. Architect taking bids due April 2nd.

Service Station, River Road and Eighteenth street, Camden, N. J. Architect, Harold A. Allen, 526 Stevens street, Camden, N. J. Owner, B. Koons, care of architect. Brick, oriental stucco, one story, 18r24 feet, metal, Spanish tile roof, cement and wood floors, plumbing, electric light (heating reserved). Architect taking bids, due April 2nd.

Store Frant (alts. and add.), Hamilton St., Trenton, N. J. Architect, L. A. Kaplan, Fitlcharles Building, Trenton, N. J. Owner, Irving Habas, 1230 Hamilton street, Trenton, N. J. Brick, general alterations, plate glass. Architect ready for bids.

Professional Building, Elizabeth, N. J. Architevt, Frank A. Berry, Real Estate Trust Building, Philadelphia. Owner, Mrs. Mary N. Martin, care of architect. Brick, steel, reinforced concrete, five stories, L shape, 150x30x50 feet, built-up roof, cement floors, steam heat, electric light, tile and marble work. Owner taking bids from local contractors.

Storage Vaults (alts.), State House, Trenton, N. J. Architect, Alen B. Mills, Division of Architecture and Construction, Trenton, N. J. Owners, State of New Jersey, Department of Institutions and Agencies, Trenton, N. J. General alterations to storage vaults, East Wing, State House. Owners taking bids, due Aprail 12th at 1.30 P. M.

Fire Apparatus Building and Men's Quarters, Lakeland, N. J. Architect, Arnold H. Moses, Temple Building, Camden, N. J. Owners, Board of Chosen Freeholders, Court House, Camden, N. J. (a) Building for Fire Apparatus and Men's Quarters, 47,000 cubic feet. (b) House for Chief Engineer, general construction, fire apparatus, plumbing and heating, concrete road from Asyla Road to central plant. Deposit, $15.00 (refunded for return of plans on or before due date). Certiled check 10%. Owners taking bids, due April 7th at 10 A. M.

Residences and Garages (8), 1254-56-60-62-66-68-72-74 Magnolia avenue, Camden, N. J., $38,400. Owners, Pal & Plas Co., Inc., 1540 Mt. Ephraim avenue, Camden, N. J. Brick, two stories, 16x50 feet, slag roof, pine and cement floors, hot water heat, electric light. Garages 9x18 feet. Permit granted.

Residences and Garages (6), 1318-20-24-26-30-32 Van Hook street, Camden, N. J., $18,000. Owners, Pal & Plas Co., Inc., 1540 Mount Ephraim avenue, Camden, N. J. Brick, two stories, 14x50 feet, slag roof, pine and cement floors, hot water heat, electric light. Permit granted.

Residences (2), 1107-09 North Twenty-eighth street, Camden, N. J., $9,000. Architect, private plans. Owner, Charles Schaal, 2707 Cleveland avenue, Camden, N. J. Frame, two stories, 16x38 feet 7 inches, slag roof, pine floors, ppeless heat, electric light. Permit granted.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, Secretary, Broad Street Bank Buildng, Trenton, N. J.

Camden County, Route 2, Sec. 9, Pensauken Creek to Union School House Road. Ecavation, rebuilt macadam shoulders, double line reinforced concrete pavement.

Bergen County Rute 17, Sec. 1., Hackensack to Rutherfrd. Grading, earth excavation, dith excavation, borrow exvacation.

Owners taking bids, due April 12th at noon. Deposit of $10 required. Certified check 10% required. Bond.

Highway Maintenance Materials, New Jersey. Owners, State of New Jersey, State Highway Commission, A. Lee Grover, Secretary, ninth floor, Broad Street Bank Building, Trenton, N. J.

Crushed trap rock, limestone, dolomite or gneiss, washed gravel or stone, concrete size crushed stone or gravel, crushed slag, dustless screenings.

Bituminous concrete, Type FA-BC-1, or A, sheet asphalt, type SA, for repair and maintenance of bituminous concrete and sheet asphalt.

Asphalt cement emulsion, Grade AE, in containers for cold patching, in an approximate quantity of 29,400 gallons.

Asphalt cement, Grade OA-4, in containers, for pouring joints, in an approximate quantity of 48,850 gallons.

Materials for surface treatment and penetration work, tar, asphalt, lignin binder.

Specifications, form of bid, special addressed envelope, conditions under which bids will be accepted may be obtained upon request from A. W. Muid, Superintendent of Maintenance, Room 8220 Broad Street Bank Building, Trenton, N. J. Certified check 10% required.

Owners taking bids, due April 12th, 1926, at noon at ninth floor, Broad Street Bank Building, Trenton, N. J.

New Jersey Contracts Awarded

Schools (3), Clementon, Somerdale, Garden Lake, N. J. Architect, Thomas Stephen, Temple Building, Camden, N. J. Owners, Clementon Township School Board, G. W. Mayberry, Laurel Springs, N. J. Contracts awarded Somerdale School. Brick, reinforced concrete, one story, 41x61 feet, slag roof maple and cement floors, carpentry and mill work, safety treads, roof ventilators, ornamental iron work (plumbing, heating and electric work separate). Bennett McLaughlin, 3260 Ludlow street, Philadelphia, $27,300. Heating, Mechanical Equipment Co., 214 S. Twelfth street, Philadelphia, $3,945. Plumbing, Charles Leopold, Clementon, N. J., $845. Electric, Merit Electric Co., 630 Race street, Philadelphia, $900.

Contracts awarded Clementon Heights School. Brick, reinforced concrete, cut stone, two stories, 61x30 feet, slag roof, kalamein doors, bond, floor hardener, ornamental iron work, metal lath, stone, bid bond (heating, plumbing, electric separate). Fred Lange, Audubon, N. J., $32,925. Heating, American Heating & Ventilating Co., 1505 Race street, Philadelphia, $4,870. Plumbing, Charles Leopold, Clementon, N. J., $1,672. Electric, Franks & Sweeney, Camden, N. J., $1,175.

Contract awarded Garden Lake School. Brick, imitation stone, reinforced concrete, bid bond,, two stories and basement, 61x36 feet, safety treads, painting and glazing, shoring, metal lath kalamein doors ornamental iron work cast stone (heating, plumbing, lightin separate). Fred Lange, Audubon, N. J., $32,760. Heating, American Heating & Ventilating Co., 1505 Race street, Philadelphia, $3,237. Plumbing, Charles Leopold, Clementon, N. J., $1,374. Electric, Merit Electric Co., 630 Race street, Philadelphia, $990.

Store and Apartment (alts. and add.), 927 East State street, Trenton, N. J. Architect, L. S. Kaplan, Fitzcharles Building, Trenton, N. J. Owner, H. Sackin, 863 Quinton street, Trenton, N. J. Brick, stone, three stories, 25x90 feet, slag roof, hardwood floors, steam heat, electric light, metal lath, tile work, fire doors. Contract awarded to N. Milgaten, 53 Spring street Trenton, N. J.

Bank, Merchantville, N. J., $100,000. Architect, J. C. Jefferis, 312 Market street, Camden, N. J. Owners, Merchantville Trust Co., care of architect. Steel, concrete, one and two stories, 67x61 feet, slag roof, marble and hardwood floors, steam heat, electric light, tile and marble work. Contract awarded to J. W. Draper, 436 Haddon avenue, Camden, N. J.

Building, Trenton, N. J. Architects, P. L. Fowler Co., 224 East Hanover street, Trenton, N. J. Owners, Mercer Hospital, 446 Bellevue avenue, Trenton, N. J. Fireproof, three stories, 40x96 feet, asbestos built-up roof, concrete floors, hollow tile, elevators, cast stone, steam heat, electric light, metal lath, tile work rolled steel sash. Contract awarded to T. M. Day & Sons, Day Building, Trenton, N. J.

Residence and Store, 3099 Highland avenue, Camden, N. J., $8,100. Architect, Harold A. Allen, 526 Stevens street, Camden, N. J. Owner, Edward Werner, care of architect. Brick, block, two stories, 22x40 feet, slag roof, hot water heat electric light. Contract awarded to Fred L. Eichfeld, 3100 Highland avenue, Pensauken, N J.

Store Front and alts. to Building, 3802 Westfield avenue, Camden, N. J., $5,200. Architect, prvate plans. Owner, L. B. Wollison, 3802 Westfield avenue, Camden, N. J. New store front, enclosing side porth general fire repairs. Contract awarded to George K. Piper, 215 North Forty-third street, Pensauken, N. J.

Residence (add.), 248 Pine street, Camden, N. J., $2,000. Architect, private plans. Owner, L. Bantiveglio, 248 Pine street, Camden, N. J. Brick, two stores, 13x16 feet, slag roof, pine floors. Contract awarded to Frank Valeriani, 259 Spruce street, Camden, N. J.

Residences (2), 949-51 Jackson street, Camden, N. J., $8,000. Architect, private plans. Owners, L. Gdowck & J. Bernarczyk, Camden, N. J. Brick, two stories, 14x50 feet, slag roof, pine floors, hot water heat, electric light. Contract awarded to Stanley & Adam Wysocki, 1454 South Tenth street, Camden.

Road Work, New Jersey, $242,880. Owners, State Highway Commission, Broad Street Bank Building, Trenton, N. J.

Route 18, Sec. 2, Alpine to New York State Line, Bergen County Contract awarded to F. J. Groves & Sons, 114 Marlton Pike, Camden, N. J.

Miscellaneous Construction News

Armory and Arsenal Building, North Laurel, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owners, State Armory Commission, E. M. Hoopes, North Laurel, Del. Brick, steel, three stories 55x75 feet, three wings 18x30 feet, slag, concrete and slate roof, linoleum, concrete and maple floors, safety treads, metal window guards, water and dampproofing, terra cotta, ornamental iron, iron stairs, bond, hollow metal doors, steel sash, terrazzo work, metal lath (heating, plumbing and electric separate.) Architect taking bids, due April 15th. Bond of 100% of contract price required.

Bank (alts. and add.), Sixth and Market streets, Wilmington, Del. Architects, Brown & Whiteside, DuPont Building, Wilmington, Del. Owners, Security Trust and Deposit Co., J. Roselle, President, on premises. Brick, steel, stone, fireproof, three stories, 117x56 feet, fireproof roof, linoleum floors, marble floors, hollow tile, metal window guards, cut stone (heating, electric and plumbing reserved), metal lath, tile work, metal sash, hollow metal doors, grills, general alterations to interior. Architects taking bids, due April 5th.

The Turner Construction Company, formerly of 1713 Sansom St., Philadelphia, has moved to Sixth Floor, 1700 Walnut St., Philadelphia.

PLASTER

By Harry Carleton

For years we have been accustomed to seeing the interior walls of our homes covered with paper. Now we are in the midst of an era of interior decorating in which the mirror smooth wall gives way to a rough and rugged surface. In either cases the finish is expensive; it is the greatest expanse that greets the eye; it is the background against which we view furniture and pictures; it is the "skin" of the interior, and while it may not have all the qualities of "a skin you love to touch," it should have all the qualities of a skin you love to see.

And just as scars, blemishes and roughness mar a schoolgirl complexion, so cracks, poor workmanship and wavy walls disfigure plaster surfaces. Thus it is very important that all plastered surfaces be produced with painstaking care. If the base, the ground work, the thing underlying the plaster is poor, the finish coat cannot help but reflect these conditions. Only too often the plaster is blamed for failure when other things are at fault.

The greatest amount of plastering in homes is done over wood lath nailed to stud walls. To secure the best plaster work, it is necessary to make certain that these stud walls are firm and true, and

that the corners are braced well. A few cross braces placed in stud walls often help strengthen the wall so that when the plaster is applied no under strain is placed upon it.

If wood lath are used they should be clean, straight and free from defects that will cause trouble. They should be nailed on at least one quarter inch apart and the courses should be broken at every seventh lath. Breaking courses every fifth lath is even better, but slightly more expensive. The lath must be well nailed at every bearing point.

The concensus of opinion is that wood lath should be thoroughly wet down before the plaster is applied, the theory being that dry lath absorb moisture from the plaster, thus causing cracks. The writer has heard very able plasterers agree that wetting the lath causes them to swell, and that some of the moisture enters the studs, and as the plaster sets before the lath and studs dry out thoroughly, the clinch or key is broken by such drying, with consequent trouble.

It is safe to say that circumstances govern this condition. In hot, dry weather the lath should be wet in order that they do not pull moisure too rapidly from the plaster. In wet, cold weather it does not seems so important to soak the lath, but if artificial heat is to be used to dry the walls, it would seem that a thorough sprinkling would be essential.

Cheap jobs of plastering are done in so-called two-coat work: that is, a skin coat is applied to the lath, and the second coat immediately applied over it, bringing the plaster out flush with the grounds. When this mass has set, the finish coat is applied, but the first two coats are applied as one operation. When heavy grounds are used, or walls are out of true necessitating a heavy coat of plaster to bring them flush and true, the disadvantage of this method is evident.

Grounds were mentioned in the above paragraph. Usually these are square strips of wood nailed around windows and other openings, though anything that gives the plasterer a line or point to work to may be called a "ground." Only too often in false economy grounds only 5/8 inch thick are used. No first-class job of plastering, particularly over wood lath, can be done using 5/8 inch grounds. 3/4 inch is the minimum size and 7/8 inch or 1 inch is even better.

In a previous paragraph the spacing of the lath was mentioned. If you have ever seen the back of a wood lath plaster partition, you will remember that the plaster is forced through the spacing of the lath and hung down on the backs of the lath. This is the "key," and unless the keys in plaster are thick, heavy and strong the plaster cannot adhere to the wall successfully. There is little or no bond between the saw-roughed lath and the plaster, so look well to the spacing of your lath.

The corners are always subjected to more strain than other parts of the wall, so for a first-class job the exterior angles should be protected with a metal corner bead, while the interior angles should be protected with a piece of metal lath. These metal pieces reinforce the plaster. If metal lath be used in place of wood lath, many of the ills of plastering are automatically avoided. Hundreds of buildings are silent but eloquent testimony to the efficiency of metal lath in preventing cracks, and it is the safest insurance against future unsightliness and trouble to use metal lath for all plaster work.

Three coat work consists in applying a first, or covering, coat that keys or clinches thoroughly with the lath. When it is dry, the second coat is applied bringing the plaster flush with the grounds. It is "rodded" and darbied" to an even surface and allowed to dry before the finish coat is applied.

And what a myriad host of finishes are possible! A previous paragraph mentioned the mirror like surface of pure white plaster. This finish is the most common, except that the cost of modern building has eliminated the glassy, glossy shine the old time plasterer used to get. Today the walls may be true and even, but rarely polished to a shine under the trowel. This finish lends itself to painting, paper, canvas, etc.

Sand finish is a texture similar to sand paper. Sometimes color is put right into the plaster and when the plasterer is through, the wall is finished and needs no further decoration. Frequently sand finish is painted, either with oil or water colors. Wall paper or canvas cannot successfully be applied to sand finish as the grains of sand obtrude and make a rough surface.

In certain architectural types of homes, notably Spanish, the sand finish is applied very roughly, every effort being made to leave tool marks on it. Sometimes this is left to age, but more frequently it is painted and the play of light and shadow is a delight to the eye. But with this type of finish, care must be used. The plaster should fit the house, lest an anachronism similar to tan shoes worn with a Tuxedo be perpetrated.

The wall finishes possible to secure with so called "putty coat white plaster are limited only by the imaginations of those concerned. The writer saw an enchanting home in which the finish coat while still plastic had been vigorously thumbed by the plasterers, and the patted effect was lovely. This was a case in which each plasterer had made his mark.

Sponges applied to plastic plaster and pulled away, floats covered with cork, felt, etc., make so called suction finishes that are delightful relief from monotony.

Sometimes the wall is covered with little dabs of finish plaster, laid out in long crisscross lines of no pattern, and a wet brush blends the whole into a delightful irregular surface. There is no limit save imagination to the effects to be obtained.

However, plaster is the "skin" of the home. It is not a structural unit. It should carry no more than it own weight, and given a fair chance to perform the proper function as it is designed to do, plaster will make walls of never ending delight.—*Building Industry.*

A study of existing specifications for common brick recently completed by the Bureau of Standards, Department of Commerce, shows that there is need for greater simplification in acceptance procedure. It is also evident that there is at present a lack of standardized test methods, judging from present building code requirements.

Study of test data obtained from a number of laboratories shows that results from certain prescribed tests for brick have a fairly definite relation to each other, thus indicating that the number of tests necessary in grading brick may possibly be reduced.

According to the present specifications of the American Society for Testing Materials there is required an absorption test, a crushing test, and a cross-bending test. These involve too much time and expense for ordinary use although the standard has been useful for reference purposes and where large purchases have been involved. On the other hand, a transverse test can be made with simple portable equipment at the plant or on the job, and future data may prove this test sufficient.

The data were also studied for relations between water absorption of brick and weathering resistance. Freezing and thawing tests, to be conclusive, must be carried up to 100 alternations or more, and cannot generally be applied in acceptance tests. If, however, the general performance in such tests could be indicated from the amount of water absorbed by the brick in a given time as immersed in a specified manner, freezing tests would not often have to be made.

The Bureau believes that the results of its study at the present time do not justify definite conclusions or recommendations, but it has been able to collect, summarize, and compare all available test data and place this material in convenient form for those who are interested in specification and building code requirements.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

The right way to Prevent Fire Loss

The only safeguard against fire loss is to have adequate insurance protection of the right kind—insurance written in a strong, reliable company having a nation-wide organization and a reputation for promptness and service.

"The Oldest American Fire and Marine Insurance Company"

Founded 1792

Insurance Company of North America

and the

Indemnity Insurance Company of North America

write practically every form of insurance except life

"ANTI-HYDRO" Made the Leaky Walls and Pits in this Post office Waterproof

The concrete pits and the walls of the pipe tunnels in this post office leaked badly. A cement *plaster coat* mixed with "ANTI-HYDRO" was applied to the *inside* of the walls and pits. Now they are absolutely and permanently waterproof.

There is not a single concrete waterproofing or hardening problem that cannot be successfully overcome by the use of "ANTI-HYDRO." It is an easy-to-use liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. Results are guaranteed permanent.

Use "ANTI-HYDRO" on your next job. For over 22 years it has been specified by leading architects, engineers and contractors.

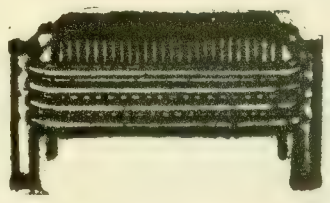
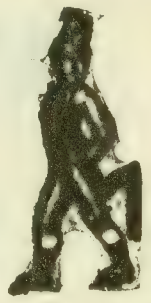
Insurance Economy

Insufficient insurance isn't economy. It takes but one loss to prove that.



The first step toward economy in insurance is to choose adequate protection, written by a company of known reliability.



The Philadelphia Fire and Marine Insurance Company is a financially strong, powerful organization with an enviable record for reliable service.

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

Have You Seen It?

Have you seen the boiler with the combustion ring? If you haven't seen it work, then you don't know the saving that the ring (illustrated below) makes in the amount of fuel used and the increased length of the firing period.

The combustion ring surrounds the firepot to a height of 4½ inches above the grates, and it has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-4.

The Philadelphia office of the Economy Concrete Co., Louis F. Nichols, representative, has moved from the Flanders Building to 1700 Walnut street, Philadelphia.

NOTABLE ARCHITECTURAL EXHIBITION WILL BE HELD IN THE GALLERIES OF THE ART ALLIANCE

Philadelphia architects and many others in New York, Boston and elsewhere are preparing special drawings and other exhibits for the Twenty-ninth Annual Architectural Exhibition of Philadelphia which will be a worthy successor to that held last year in the partly competed Art Museum.

The exhibition this year will be in the Galleries of the Art Alliance, 1823 Walnut Street. It will be held by the Philadelphia Chapter of the American Institute of Architects and the T-Square Club of Philadelphia in colaboration with The Sculpture Committee of the Art Alliance from May 9 until May 31st, 1926, inclusive, and will be open free to the public from 11 A.M. to 9 P. M. weekdays and from 1 P. M. to 6 P. M. Sundays.

Architectural Exhibits will consist of drawings, models and photographs of proposed or executed work; of structural, decorative and landscape architecture, academic drawings; sketches and paintings of decorative subjects. Groups consisting of drawings, models and cartoons, illustrating in collaboration the architectural, sculptural and decorative scheme of a single work will be patricularly featured.

The Jury of Selection consists of Clarence C. Zantzinger, Charles Z. Klauder and Paul A. Davis, 3rd, the latter of whom is the President of the Philadelphia Chapter.

THREE LECTURES ON MODERN AMERICAN. ARCHITECTURE AT THE ACADEMY OF MUSIC

Announcement is made by the Directors of The University Extension Society, to whom has been entrusted the management of THE JAYNE MEMORIAL LECTURES, founded by The University Extension Society and the friends of the late Henry LaBarre Jayne, in his memory that the second series of lectures will be in the Academy of Music, on Friday evenings, April 16th, 23rd and 30th.

These will be delivered by George H. Edgell, Dean of the Faculty of Architecture, and Chairman of the Council of the School of Architecture, Harvard University. One of America's distinctive contributions to civilization has been its leadership, during the last quarter century, in the teaching and practice of architecture. It is this which Dean Edgell will discuss in his lectures, entitled "Modern American Architecture.'

The first lecture will deal with the current theories of architecture and the traditions and development of American Architecture. Illustrations will show the monuments of the past which affect the architecture of today. The second lecture will treat of domestic, academic and ecclesiastic architecture of America today, and the third will cover the public and monumental present day architecture and show a wide range of illustrations including the modern development of commercial buildings.

The lectures will be fully illustrated by lantern slides and will be interesting and instructive to architects, builders and all others allied with the construction industry and to the lay public. All are invited and as admission to the Academy of Music may be had only by tickets, the Jayne Memorial Lectures, 1617 Land Title Building, will without charge, furnish tickets, to the limit of capacity, in the order of application.

METAL LATH NEARLY 100% SIMPLIFIED, REPORT SHOWS

Reports that the production of metal lath under Simplified Practice Recommendations which became effective on January 1, 1924, had been 99 per cent in conformity with the sizes recommended as standard were made at a meeting of manufacturers of metal lath today in the Department of Commerce under the auspices of the Division of Simpified Practice. The industry involves more than 40,000 tons of steel annually. ffl ffl

The meeting was held to consider possible revisions of the program already in effect, and the manufacturers present represented more than 75 per cent of the production of the country. H. R. Colwell of the Division presided.

On behalf of the Simplification Committee of the Associated Metal Lath Manufacturers, Walter C. Congor of Truscon Steel Co., Youngstown, Ohio, stated that the industry had made important progress since the Simplified Practice Recommendations became effective. Wharton Clay, Commissioner of the Association, has estimated that the dealers, distributors, and the producers have been relieved of an investment of more than $2,000,000 which represents stocks formerly carried in the 125 sizes and weights formerly made.

The meeting resulted in the appointment of a committee comprising of W. C. Conger of Youngstown, John Bowditch, Jr., of the Youngstown Pressed Steel Co., Warren, Ohio, representing manufacurers; H. R. Eastwood of the Southern Building & Supply Co., Washington, and James W. Pearse of the Pearse Fireproofing Co., Philadelphia, representing distributors; LeRoy Kern of the American Institute of Architects, J. H. Krafft of Krafft-Murphy Co., Washington, W. J. McSorley of the Building Trades Division of the American Federation of Labor, and a representative of the International Association of Plastering Contractors representing consumers. This meeting will present specific recommendations as to further reductions at a meeting which is to be held on May 26th, and these recommendations will be submitted to the entire industry for acceptance.

The attendance was as follows: W. S. Hays, National Council for Better Plastering, Philadelphia, Pa.; Mahlon D. Scott, Consolidated Expanded Metal Co., Philadelphia; W. C. Conger, Youngstown, Ohio; E. R. Stewart, North Western Expanded Metal Co., Chicago, Ill.; John Bowditch, Jr., Warren, Ohio; Thomas R. Herbest, Jr., Consolidated Expanded Metal Co., Bradock, Pa.; W. B. Turner, General Fireproofing Building Products, Youngstown, Ohio; and representatives of the Division of Simplified Practice.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

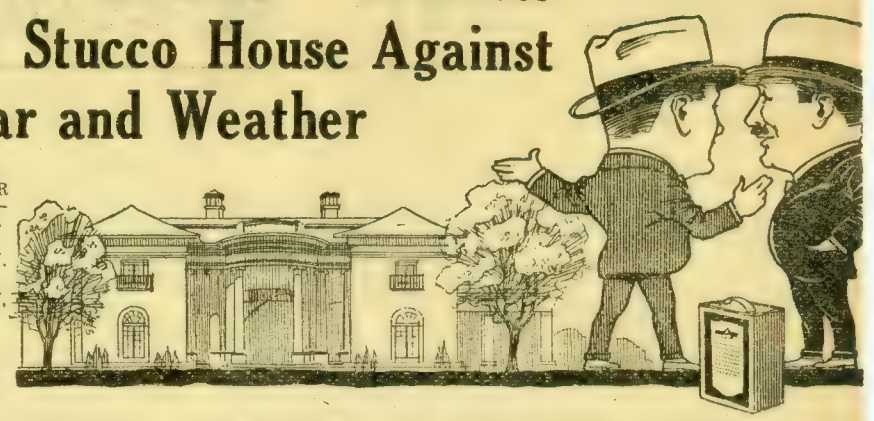
A GIANT REVOLVING SEARCHLIGHT



is on top the new Insurance Company of North America Building at 16th Street and the Parkway. Its beam of light is always visible at a distance of twenty-five miles and can be seen, according to atmospheric conditions, fifty, seventy-five and even one hundred miles away. L. P. Bertaud, Air Mail Pilot, reported seeing it at Bellefont Field—150 miles from Philadelphia. It is nearly a third of a billion candlepower and is the largest light ever installed for advertising purposes in the East.

This beacon light, reaching out beyond the limits of the city in every direction, is significant of the far-reaching influence of the Insurance Company of North America. Founded in Philadelphia 134 years ago, this oldest American fire and marine insurance company has extended its organization and service until today it reaches around the world.

Insurance Company of North America

PHILADELPHIA

"ANTI-HYDRO" Protects this Stucco House Against Wear and Weather

C. J. WALKER RESIDENCE—IRVINGTON-ON-THE-HUDSON, N. Y.

V. W. TANDY, ARCH.

MILLER, REED & CO., BUILDERS

"ANTI-HYDRO" both hardens and waterproofs stucco in one operation. It prevents stucco from chipping, crazing, map-racking and discoloration, and insures a dry interior at all times. The admixture of "ANTI-HYDRO" makes portland cement bond securely to tile, brick or concrete. Any tone may be obtained through the addition of a dry mortar color or it may be used with pure white cement, without dimming or changing the color.

"ANTI-HYDRO" is a liquid integral compound. It mixes readily with the gauging water—any unskilled workman can do it. For 22 years it has proved its superiority. Use it on your next job for permanently hard and waterproof stucco work.

Insurance Economy

Insufficient insurance isn't economy. It takes but one loss to prove that.

The first step toward economy in insurance is to choose adequate protection, written by a company of known reliability.

The Philadelphia Fire and Marine Insurance Company is a financially strong, powerful organization with an enviable record for reliable service.

(Signed)
Building News Publishing Co.,
Louis S. DeLone, Business Manager.

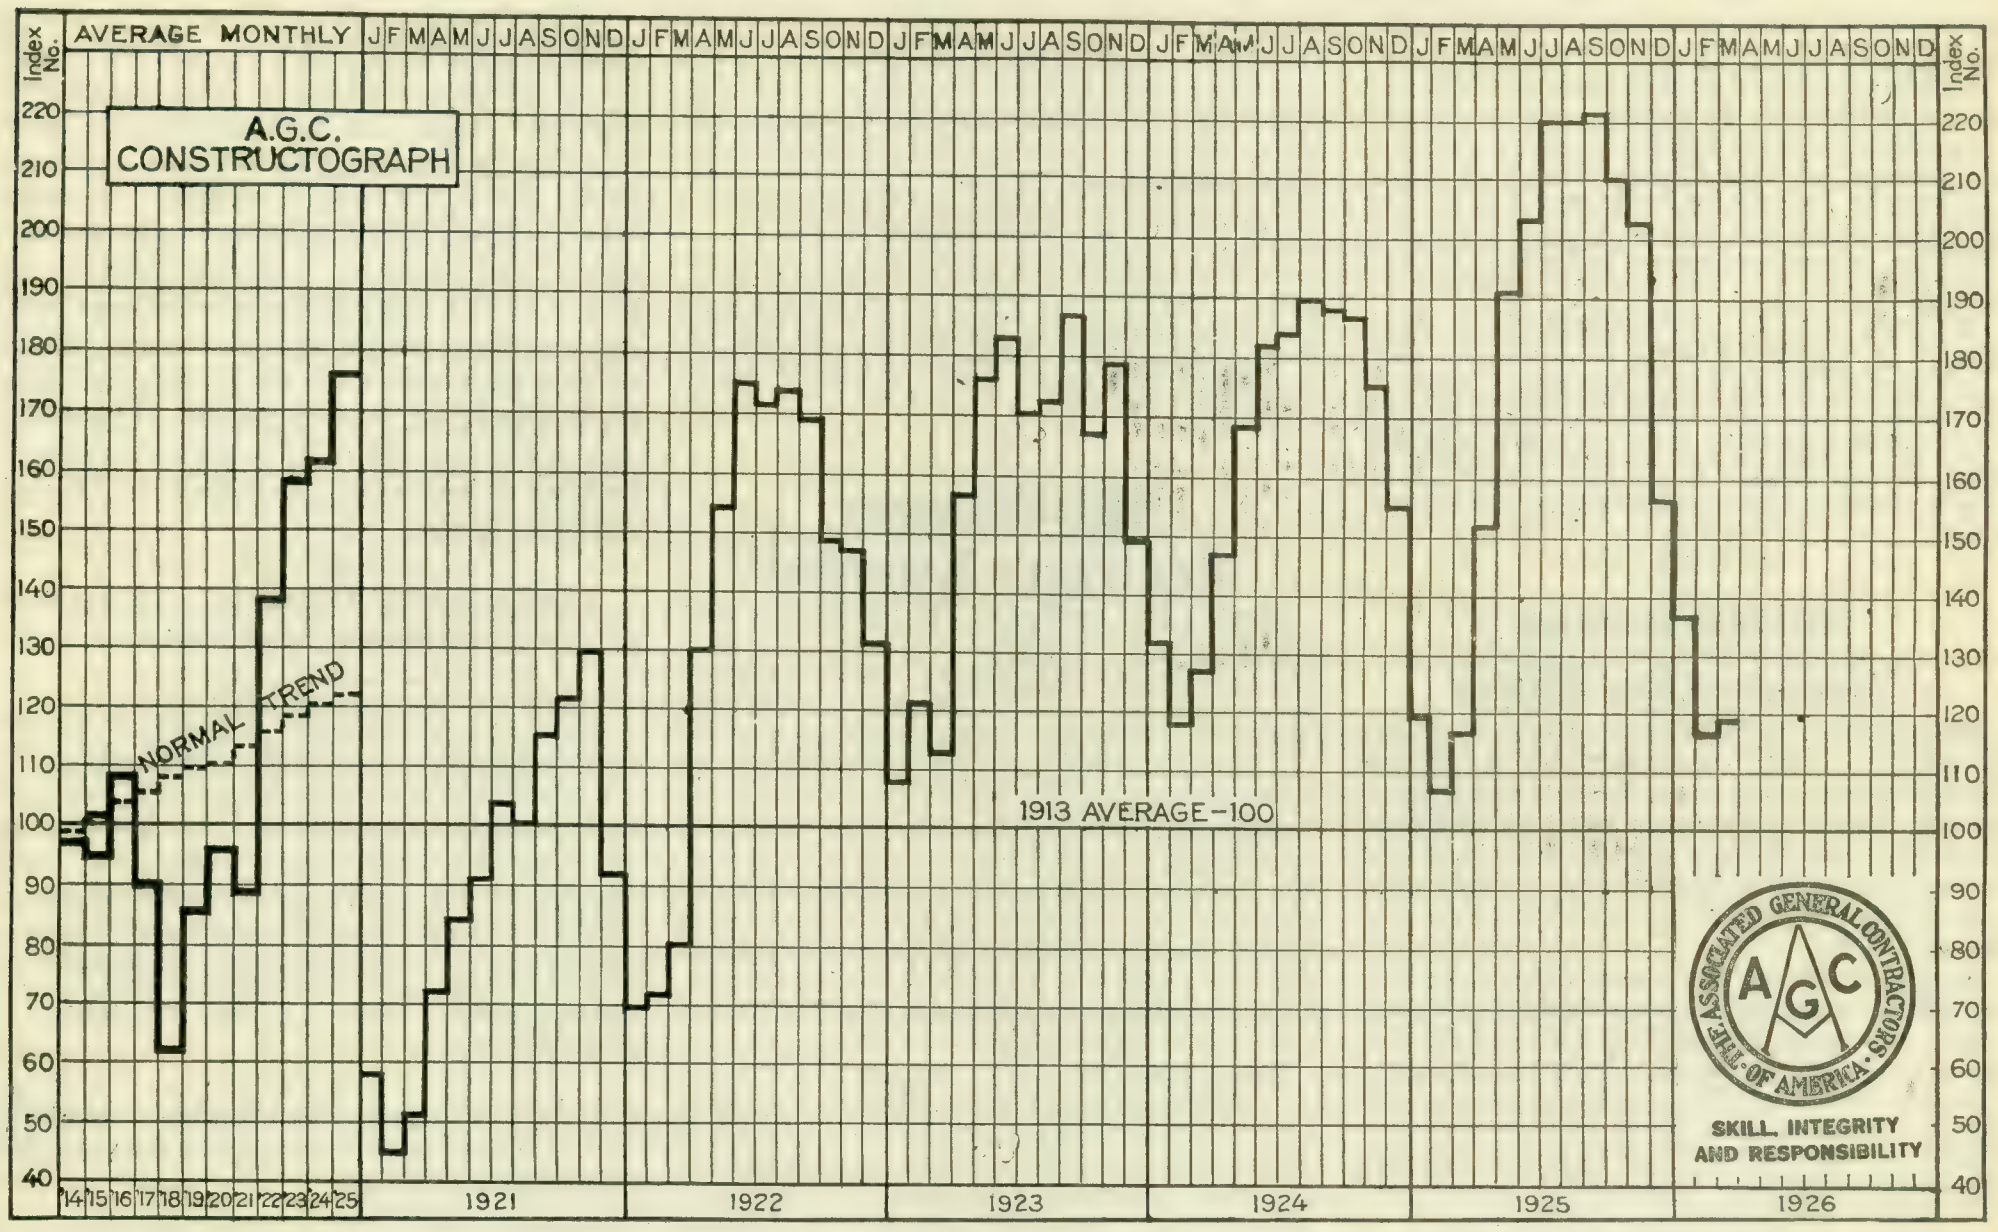
Sworn and subscribed before me this 12th day of March, 1926.

H. A. Lang, Notary Public.

(My commission expires March 2, 1929.)

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

The BUILDERS' GUIDE is in its fortieth year of continuous publication.



Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

VOLUME OF CONSTRUCTION

Washington, April 11.—Construction operations lulled in March. Experts do not attach significance to this condition, however. They are inclined to believe a season of high activity will follow. Statistics compiled by the Associated General Contractors of America show the number of contracts awarded and of building permits issued during the first three months of 1926 to be in excess of the corresponding figures for 1925. This is interpreted to mean that the volume of construction operations during the next few months will probably approach or equal the marks set last year.

Construction in March did not show the increase over February that usually is expected each year. Despite this fact, the volume of operations for the first three months of this year were 9 per cent greater in volume than the amount shown for the first quarter of 1925.

The average of construction costs in the principal building centers dropped slightly during March. With the exception of February, when a barely perceptible increase was registered, these costs remained on a single level throughout the preceding five months.

The average wage paid in the construction trades has not varied during six months. The slight decrease in the average cost of building materials last month was the result of a flickering change in prices paid in several localities by contractors for sand, gravel, crushed stone and cement.

With the first quarter of the year passed, it is regarded as evident that a large number of prospective builders who already have awarded contracts and secured permits for construction which they contemplate merely are awaiting advent of the spring and summer months to give the word for operations to begin. Observers generally given credit for authoritative opinion do not expect this year in its entirety to fall much below the record-breaking construction operations of 1925. They do feel confident, however, the spring and early summer months will see building activities reach a level higher than was achieved in the corresponding periods of 1924 and 1925.

SUBSTANCES CONTAINING GRIT AND SALTS SHOULD NOT BE USED AS A CLEANING MATERIALS FOR MARBLE

In connection with the various investigations being made at the Bureau of Standards relative to the use and maintenance of interior marble one problem that is being studied is the effect of certain ingredients of trade cleaners on the marble. The Bureau has previously pointed out that cleaners of the scouring types are too harsh for use on polished marble because the grits usually employed are harder than marble and gradually destroy the polish. Another question which appears to be of considerable importance in connection with marble cleaning is the effect of such detergents as soda ash and trisodium phosphate. When such salts are frequently used they crystallize in the pores of the marble and in some cases exert enough pressure to deface the surface. Sucient evidence has been developed to justify a limitation of the use of such detergents, especially in cases of costly marble installations where it is desirable to preserve the highly prized tones and character of the original material.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

Many a man would do a better job if he didn't know about putty.—Ex.

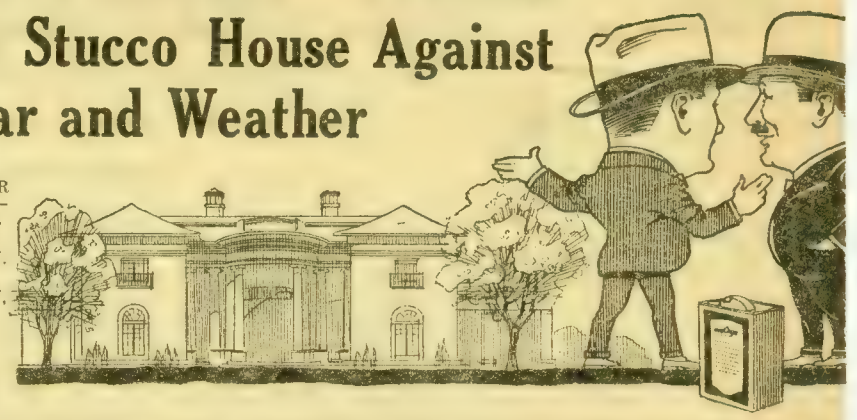
A GIANT REVOLVING SEARCHLIGHT



is on top the new Insurance Company of North America Building at 16th Street and the Parkway. Its beam of light is always visible at a distance of twenty-five miles and can be seen, according to atmospheric conditions, fifty, seventy-five and even one hundred miles away. L. P. Bertaud, Air Mail Pilot, reported seeing it at Bellefont Field—150 miles from Philadelphia. It is nearly a third of a billion candlepower and is the largest light ever installed for advertising purposes in the East.

This beacon light, reaching out beyond the limits of the city in every direction, is significant of the far-reaching influence of the Insurance Company of North America. Founded in Philadelphia 134 years ago, this oldest American fire and marine insurance company has extended its organization and service until today it reaches around the world.

Insurance Company of North America

PHILADELPHIA

"ANTI-HYDRO" Protects this Stucco House Against Wear and Weather

C. J. WALKER RESIDENCE—IRVINGTON-ON-THE-HUDSON, N. Y.

V. W. TANDY, ARCH.

MILLER, REED & CO., BUILDERS

"ANTI-HYDRO" both hardens and waterproofs stucco in one operation. It prevents stucco from chipping, crazing, map-racking and discoloration, and insures a dry interior at all times. The admixture of "ANTI-HYDRO" makes portland cement bond securely to tile, brick or concrete. Any tone may be obtained through the addition of a dry mortar color or it may be used with pure white cement, without dimming or changing the color.

"ANTI-HYDRO" is a liquid integral compound. It mixes readily with the gauging water—any unskilled workman can do it. For 22 years it has proved its superiority. Use it on your next job for permanently hard and waterproof stucco work.

Insurance Economy

Insufficient insurance isn't economy. It takes but one loss to prove that.

The first step toward economy in insurance is to choose adequate protection, written by a company of known reliability.

The Philadelphia Fire and Marine Insurance Company is a financially strong, powerful organization with an enviable record for reliable service.

1.

Straight, deep firepot. Straight pot prevents the collection of ashes along the side as occurs in sloping firepot. This collection of ashes always has a deadening effect on the fire just where it should be hottest.

A deep firepot allows for deeper fuel bed and enables you to carry fire throughout the day or over night.

2.

The combustion ring. Latest improvement in round boilers. Prevents the lower portion of the fire bed from coming in contact with the chilling water section around the firepot, which chills the fire below the temperature of combustion. Gives the boiler a longer firing period and saves fuel.

3.

Large clean out door which gives easy access to the flue travel.

4.

Waterways on the outside of the boiler instead of inside the firepot permits the grate and the firepot to be full size, thus increasing the coal carrying capacity of the boiler.

5.

High base which furnishes the proper air space between the hot ashes and the grates so as to give longer life to the grates.

No. 1423 NOVELTY Round Boiler
For Hot Water Heating

Have You Seen It?

Have you seen the boiler with the combustion ring? If you haven't seen it work, then you don't know the saving that the ring (illustrated below) makes in the amount of fuel used and the increased length of the firing period.

The combustion ring surrounds the firepot to a height of 4½ inches above the grates, and it has increased the heating capacity alone of the boiler to equal that of a size larger in the old style type.

This ring prevents the lower portion of the firebed from coming in contact with the water sections which surround the firepot. The cool water returning from the radiators, enters both sides of the boiler at the bottom of the water section. This water, because it is much cooler than the fire, chills the fire around the sides of the pot, below the temperature of combustion. The result is, that the boiler requires more frequent attention. Also, partly burned fuel along the sides of the firepot is wasted because there is no fire under it to burn it and it settles down to the grates, passing to the ashpit when the fire is shaken.

But with the combustion ring, there is a clean, even-burning fire over the entire area of the firepot. There is no water back of the ring to draw the heat from the fire and to chill it. All of the fuel is completely consumed and more heat is produced from the same amount of coal burned.

You will be pleased with the results obtained from the Novelty Boiler with the combustion ring. Write today for the booklet that fully explains them. Address Dept. BG-4.

Which Bid Is Right?

Low Bid	-	$34,665.00
Second Bid	-	40,995.00
Others up to		46,398.00

These are actual bids recently submitted for the same job. They are not exceptional. They show why many good builders go broke. Correct estimating methods would eliminate such guessing and take much of the risk out of contracting. Particulars sent free to *bona fide* contractors.

Slag Concertte (Metal) $35,164.00 (Non-Metal) $34,166.50.

W. Edward Pierce, Builder, formerly of 328 S. Juniper St., Philadelphia, has opened new offices at Room 313, 1600 Arch Street, Philadelphia.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

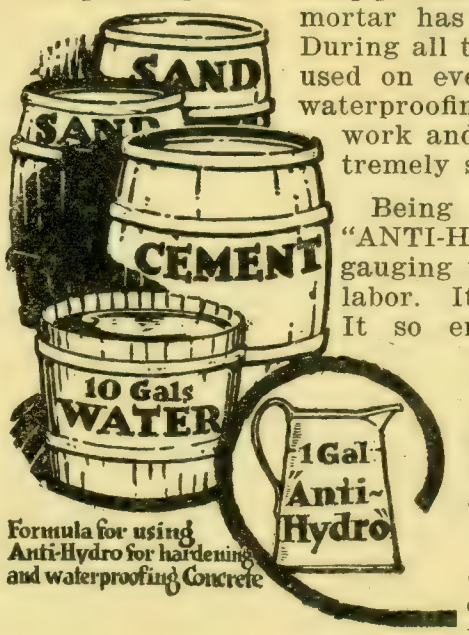
A GIANT REVOLVING SEARCHLIGHT

is on top the new Insurance Company of North America Building at 16th Street and the Parkway. Its beam of light is always visible at a distance of twenty-five miles and can be seen, according to atmospheric conditions, fifty, seventy-five and even one hundred miles away. L. P. Bertaud, Air Mail Pilot, reported seeing it at Bellefont Field—150 miles from Philadelphia. It is nearly a third of a billion candlepower and is the largest light ever installed for advertising purposes in the East.



This beacon light, reaching out beyond the limits of the city in every direction, is significant of the far-reaching influence of the Insurance Company of North America. Founded in Philadelphia 134 years ago, this oldest American fire and marine insurance company has extended its organization and service until today it reaches around the world.

Insurance Company of North America

PHILADELPHIA

Twenty-two Years Without a Change

This "ANTI-HYDRO" formula for permanently hardening, waterproofing and damp-proofing concrete, stucco and cement mortar has stood unchanged for 22 years. During all this time it has been successfully used on every type of concrete hardening, waterproofing, acid, alkali, and oil-resisting work and has never failed to produce extremely satisfactory results.

Formula for using Anti-Hydro for hardening and waterproofing Concrete

Being a liquid integral compound, "ANTI-HYDRO" mixes readily with the gauging water without the aid of skilled labor. It is easy and economical to use. It so enriches the concrete that one troweling is usually sufficient for a perfect finish. It also strengthens the concrete and accelerates the hardening of cement, thus eliminating costly overtime work.

"ANTI-HYDRO" is the oldest compound of its kind in existence. Use it on your next job for real, lasting satisfaction.

Insurance Economy

Insufficient insurance isn't economy. It takes but one loss to prove that.

The first step toward economy in insurance is to choose adequate protection, written by a company of known reliability.

The Philadelphia Fire and Marine Insurance Company is a financially strong, powerful organization with an enviable record for reliable service.

ANNOUNCEMENT

John F. Dakin, trading as Philadelphia Building Materials Co., is no longer associated with Toch Bros. "R I W." Toch Bros. merged with the Standard Varnish Co. and eliminated this agency.

After twelve years as distributing agent for "R I W," Mr. Dakin knows the materials thoroughly and will continue under his own name, Philadelphia Building Materials Co., manufacturing "K-D-P"—Keystone-Dampproof-Products.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

Contract awarded to James C. Powell, 19 South Liberty street, Cumberland, Md.

FINANCING A HOME

A lack of understanding as to how to finance the building of a home rather than a lack of a desire to own a home is what keeps most people from building. In reality, the financing of a small home is not difficult. There are three methods of home financing: (1) membership in a Building and Loan Association, (2) borrowing on first and second mortgages and (3) paying on contract.

The operation of Building and Loan Associations is fairly familiar to most home builders as these associations will be found in almost every city and town. The general procedure is to become a member of the association by opening a savings account with them. The application is made for a mortgage loan when required. This loan is usually on a basis of 60 per cent to 70 per cent on the combined value of the land and building; repayable on a monthly basis, at the rate of 1 per cent. per month on the face amount of the mortgage. Thus, for a mortgage of $5,000 the monthly payment would be $50.00, part of which is applied to the principal; the balance being used as interest which is adjusted month-

ly. Such loans as a rule, bear an interest rate of 6 per cent. On this basis it takes eleven years and seven months to pay off the above mortgage completely.

The real difficulty that is encountered in financing thousands of potential small home owners is the lack of established credit. Often these home builders require loans on terms of repayment that do not attract a lender. Again they may not have accumulated sufficient capital to put into the project that would constitute a substantial equity in the home desired.

Now besides the three methods of home financing already mentioned, another plan has been devised to encourage the modest home builder. It is rather a unique plan instituted by one of the largest insurance companies in the country. This scheme provides ten years, 6 per cent. mortgage loans on desirable home property throughout the United States. The loans are payable in one-hundred and twenty equal monthly installments. Life insurance to the amount of the loan is required as collateral security to protect the dependents against the burden of the debt and to protect the company as mortgagee. The monthly installment includes interest, life insurance premium, and the payment on account of principal.

Death is the chief hazard to which the purchasers of homes are subjected and which perhaps is the main cause of foreclosure. With this plan in operation, should death intervene during the payment period, the mortgage is paid immeditely by the life insurance company and anything in excess of the debt is paid over to the beneficiary. With everything going normally and the head of the house, the insured, living, the mortgage is paid off gradually and in about ten years the home may be free and clear of debt. It is much better to inherit a home paid up than a home saddled with a mortgage.

The benefits of such a scheme are numerous. An ordinary mortgage may fall due or be called in at short notice in times of financial stress. Money lenders often ask payment in full at maturity or demand heavy payments on account. Frequently the borrower may not be able to replace the mortgage, which may result in the loss of his property and savings or, if other funds can be obtained at such a critical time, the lenders will likely charge exorbitant commissions and high interest rates on the new loan.

Furthermore, in the ordinary purchase of a home, the necessary cost of examination of title, appraisal, survey and etc., make up a considerable item. Generally the borrower bears all of this expense, but in the plan of the insurance company, the company assumes the burden. By this plan, the scheme also permits pre-payment if the loan has been in force three years so that the borrower may clear up his debt in less than the ten years should he so desire.

While it is easy enough to place a first mortgage on one's home provided it is well constructed and in a good neighborhood, the placing of the second mortgage, which is so often necessary, is quite a difficult matter. The first mortgage often has to be supplimented by a second mortgage loan representing up to 25 per cent. or more of the cost of the land and house combined. Since the second mortgage bears the brunt of any misfortune which may happen to property, usually in addition to 6 per cent. or 7 per cent. interest, a bonus is required to induce the lending concern to take the risk.

If taxes or interest are not paid and it becomes necessary for the holder of the first mortgage to foreclose, the holder of the second mortgage must be in position to pay off the first mortgage and protect his own interest, otherwise under foreclosure procedure, the investment is in danger of being wiped out. Often when a home is built under first and second mortgages, the owner is dangerously close to "shoe string" financing.

First mortgage loans generally run for a period of three years. Second mortgages extend over a longer period, five years usually being acceptable to realtors. Savings banks, title companies and certain other financial institutions usually do not deal in second mortgages, consequently this second mortgage business is handled by those less responsible. While most subscribers of second mortgage money are dependable and honorable in their business dealings, there is still need to warn against organizations whose policy is in making a second mortgage loan to charge as great a bonus as it will bear, and to foreclose immediately upon termination of the loan unless the owner pays off the entire principal. Careful reading of the terms of all mortgage papers is wise.

No matter what the size of the loan is, it is always the best policy to arrange for partial payments at regular intervals. Thus on a loan of $5,000 at 6 per cent. interest, payments of $50.00 a month will take care of the interest on the loan and cancel the principal in less than 12 years, thus leaving the home free of debt. If regular payments do not have to be made, there is no stimulus to meet the obligation and often sufficient savings have not been accumulated to cover the total sum when it is needed and loans often drag along over the greater portion of a family'se life time.

When these three methods of financing the small home are made known to the potential home owner and he awakens to the practical possibilities of owning a home, the first and greatest step towards building and owning a home has been taken.

Representatives of manufacturers of hollow metal doors and trim, used in building operations, met recently in preliminary conference at the Department of Commerce to consider the possibility of simplifying sizes, types, and other matters connected with these products. W. Chattin Wetherill, Director of Metals Utilization, presided.

H. G. Garlock of Cleveland, O., secretary of the Hollow Metal Door and Trim Manufacturers' Association, was named as chairman of a simplification committee; the other members of the committee being George Hughes of the United Metal Products Company, Canton, O.; E. T. Johnson, of the Art Metal Construction Co., Jamestown, N. Y.; and Ernest C. Probst, of the Metal Door and Trim Co., La Porte, Ind.

This committee will place before manufacturers throughout the country a tentative program of simplification, and plans to complete tentative simplification recommendations, which can be submitted to a general conference of manufacturers, distributors and users, building engineers, architects and others.

The attendance at the conference included members of the committee and E. W. Sellstrom, of the Dahlstrom Metallic Door Co., Jamestown, N. Y., and Oscar Nyman of the United Metal Products Co., Canton, O., as well as representatives of the Bureau of Standards and Division of Simplified Practice.

WE ASK YOU

Isn't it funny?
THAT A MAN WHO CONSIDERS
HIMSELF A BUSINESS MAN
Will get up in the morning
From an advertised mattress,
And put on advertised underwear,
Advertised hose, shirt, collar, tie and shoes.
Seat himself at a table and
Eat advertised breakfast food,
Drink advertised coffee or substitute,
Put on an advertised hat,
Light an advertised cigar,
Go to his place of business and
TURN DOWN ADVERTISING ON THE GROUND THAT ADVERTISING DOESN'T PAY!

Repitition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

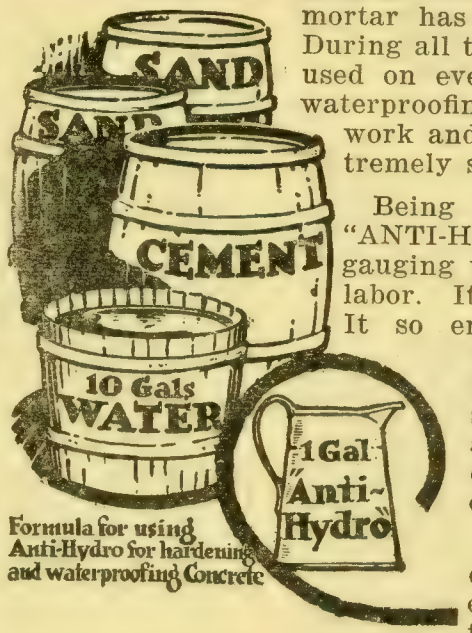
A GIANT REVOLVING SEARCHLIGHT

is on top the new Insurance Company of North America Building at 16th Street and the Parkway. Its beam of light is always visible at a distance of twenty-five miles and can be seen, according to atmospheric conditions, fifty, seventy-five and even one hundred miles away. L. P. Bertaud, Air Mail Pilot, reported seeing it at Bellefont Field—150 miles from Philadelphia. It is nearly a third of a billion candlepower and is the largest light ever installed for advertising purposes in the East.



This beacon light, reaching out beyond the limits of the city in every direction, is significant of the far-reaching influence of the Insurance Company of North America. Founded in Philadelphia 134 years ago, this oldest American fire and marine insurance company has extended its organization and service until today it reaches around the world.

Insurance Company of North America

PHILADELPHIA

Twenty-two Years Without a Change

This "ANTI-HYDRO" formula for permanently hardening, waterproofing and damp-proofing concrete, stucco and cement mortar has stood unchanged for 22 years. During all this time it has been successfully used on every type of concrete hardening, waterproofing, acid, alkali, and oil-resisting work and has never failed to produce extremely satisfactory results.

Formula for using Anti-Hydro for hardening and waterproofing Concrete

Being a liquid integral compound, "ANTI-HYDRO" mixes readily with the gauging water without the aid of skilled labor. It is easy and economical to use. It so enriches the concrete that one troweling is usually sufficient for a perfect finish. It also strengthens the concrete and accelerates the hardening of cement, thus eliminating costly overtime work.

"ANTI-HYDRO" is the oldest compound of its kind in existence. Use it on your next job for real, lasting satisfaction.

WORLD FAMOUS STRUCTURES

CATHEDRAL OF NOTRE DAME · PARIS · FRANCE ·

OF ALL the noble structures in Paris, France, the first in importance is the cathedral of Notre Dame. It is one of the finest Gothic monuments in existence.

The plan of the edifice is that of a regular cross. At the western extremity are two towers which form conspicuous objects from most parts of the city, and were evidently intended to support spires.

The date of this church is variously given, or rather it has been achieved, like most ancient cathedrals, at different epochs, beginning in the eleventh century. The high altar was consecrated in 1082, the western front, designed by Maitre Jehan de Chelles, was built in 1223. The last addition is a small portal and was erected in 1407 by Jean Sans Peur, Duke of Burgundy, the assassin of the Duke of Orleans, in expiation of his crime.
